NOTE

JPRS publications contain information primarily from foreign newspapers, periodicals and books, but also from news agency transmissions and broadcasts. Materials from foreign-language sources are translated; those from English-language sources are transcribed or reprinted, with the original phrasing and other characteristics retained.

Headlines, editorial reports, and material enclosed in brackets [] are supplied by JPRS. Processing indicators such as [Text] or [Excerpt] in the first line of each item, or following the last line of a brief, indicate how the original information was processed. Where no processing indicator is given, the information was summarized or extracted.

Unfamiliar names rendered phonetically or transliterated are enclosed in parentheses. Words or names preceded by a question mark and enclosed in parentheses were not clear in the original but have been supplied as appropriate in context. Other unattributed parenthetical notes within the body of an item originate with the source. Times within items are as given by source.

The contents of this publication in no way represent the policies, views or attitudes of the U.S. Government.

PROCUREMENT OF PUBLICATIONS

JPRS publications may be ordered from the National Technical Information Service (NTIS), Springfield, Virginia 22161. In ordering, it is recommended that the JPRS number, title, date and author, if applicable, of publication be cited.

Current JPRS publications are announced in Government Reports Announcements issued semimonthly by the NTIS, and are listed in the Monthly Catalog of U.S. Government Publications issued by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.

Correspondence pertaining to matters other than procurement may be addressed to Joint Publications Research Service, 1000 North Glebe Road, Arlington, Virginia 22201.

Soviet books and journal articles displaying a copyright notice are reproduced and sold by NTIS with permission of the copyright agency of the Soviet Union. Permission for further reproduction must be obtained from copyright owner.

PHYSICS AND MATHEMATICS

CONTENTS

ACOUSTICS

Radiation-Collision Sound Source (F. Kh. Gel'mukhanov; KVANTOVAYA ELEKTRONIKA, No 3, Mar 84).....	1
Characteristics of Impulse Acoustooptical Effect in Gases (L. N. Vereshchagina, et al.; ZHURNAL TEKHNICHESKOY FIZIKI, No 2, Feb 84).....	1
Determination of Frequency Characteristics of Impedance of Three-Dimensional Acoustic Elements by Geometric Construction Method (L. A. Borisov, Yu. A. Gasparyan; IZVESTIYA AKADEMII NAUK ARMYANSKOY SSR: SERIYA TEKHNICHESKIKH NAUK, No 1, Jan-Feb 84).....	2
Surface Acoustic Wave Attenuation in Piezoelectrics During Interaction With Plasma Gas Discharge (A. A. Dobrovolskiy, et al.; PIS'MA V ZHURNAL TEKHNICHESKOY FIZIKI, No 6, 26 Mar 84).....	2
Scattering of Plane Wave on Cylindrical Shell in Low-Frequency Region (A. P. Paniklenko, S. A. Rybak; AKUSTICHESKIY ZHURNAL, No 2, Mar-Apr 84).....	3
Statistics of Beam Arriving at Assigned Point in Heterogeneous Medium With Fluctuating Parameters (A. A. Moiseyev; AKUSTICHESKIY ZHURNAL, No 2, Mar-Apr 84).....	3
Space-Time Correlation of Narrowband Noise Signal in Shallow Ocean (V. M. Kudryashov; AKUSTICHESKIY ZHURNAL, No 2, Mar-Apr 84).....	4

Reorientation of Magnetic Moments of Antiferromagnets in Acoustic Wave Field (L. A. Koyrakh, V. L. Preobrazhenskiy; AKUSTICHESKIY ZHURNAL, No 2, Mar-Apr 84).....	4
Influence of Random Field of Internal Waves on Acoustic Propagation in the Ocean (N. S. Gorskaya, M. A. Rayevskiy; AKUSTICHESKIY ZHURNAL, No 2, Mar-Apr 84).....	5
Experimental Investigation of Attenuation of Acoustic Ground Wave (N. N. Bochkarev, et al.; AKUSTICHESKIY ZHURNAL, No 2, Mar-Apr 84).....	5
Acoustoelectronic Nonlinear Effects During Reflection of Acoustic Waves (V. V. Bozhenko, et al.; AKUSTICHESKIY ZHURNAL, No 2, Mar-Apr 84).....	6
Conditions for Coherent Combination of Waves During Backscattering of Sound in Channels During Multipath Propagation (Kh. G. Akhunov, Yu. A. Kravtsov; AKUSTICHESKIY ZHURNAL, No 2, Mar-Apr 84).....	6
Radiation of Body Moving Uniformly Over Periodic Structure (N. S. Stakun; AKUSTICHESKIY ZHURNAL, No 2, Mar-Apr 84).....	6
Scattering of Waves by 'Black' Sphere (I. A. Urusovskiy; AKUSTICHESKIY ZHURNAL, No 2, Mar-Apr 84).....	7
Effectiveness of Wave Vibration-Absorbing Coating of Ribbed Rod (V. B. Stepanov, B. D. Tartakovskiy; AKUSTICHESKIY ZHURNAL, No 2, Mar-Apr 84).....	7
Establishment of Forced Oscillations in Acoustic Resonators (V. E. Gusev; AKUSTICHESKIY ZHURNAL, No 2, Mar-Apr 84).....	8
Optimization of Dissipative Characteristics of Foundation Construction for Power Equipment (A. V. Ionov; AKUSTICHESKIY ZHURNAL, No 2, Mar-Apr 84).....	8
Slowly Rotating Pulsed Radiation Source (Yu. L. Levkovskiy; AKUSTICHESKIY ZHURNAL, No 2, Mar-Apr 84).....	9

Mutual Spectrum of Radiated Noise Signal and Signal Reflected From Stratified Ocean Floor (V. V. Krasnaborod'ko; AKUSTICHESKIY ZHURNAL, No 1, Jan-Feb 84).....	9
Parametric Excitation of Transverse Slot Acoustic Waves in Solid Bodies by Microwave Electrical Field (T. I. Bondarenko; AKUSTICHESKIY ZHURNAL, No 1, Jan-Feb 84).....	10
Investigation of Irregularities of Ocean Bottom by Amplitude-Modulated Signal (I. V. Sheynfel'd; AKUSTICHESKIY ZHURNAL, No 1, Jan-Feb 84).....	10
Analysis of Horizontal Refraction of Acoustic Waves in Shallow Ocean by Perturbation Method (Yu. A. Kravtsov, et al.; AKUSTICHESKIY ZHURNAL, No 1, Jan-Feb 84).....	11
Radiation of Equatorial Spherical Band With Pulsating Surfaces (S. B. Keleberdenko, et al.; AKUSTICHESKIY ZHURNAL, No 1, Jan-Feb 84).....	11
Similarity Criteria of Spectra of Pressure Pulsations of Turbulent Boundary Layer Near Wall (B. M. Yefimtsov; AKUSTICHESKIY ZHURNAL, No 1, Jan-Feb 84).....	12
Simulation of Vibration Processes in Damped Structures With Allowance for Temperature-Frequency Characteristics of Vibration Absorbing Materials (L. Ye. Buvaylo, A. V. Ionov; AKUSTICHESKIY ZHURNAL, No 1, Jan-Feb 84).....	12
Intrinsic Oscillations of Barrier in Infinite Waveguide (B. P. Belinskiy; AKUSTICHESKIY ZHURNAL, No 1, Jan-Feb 84).....	12
Influence of Radiation Waveguide on Elastic Pulse Shape During Laser Excitation (V. I. Arkhipov, et al.; AKUSTICHESKIY ZHURNAL, No 1, Jan-Feb 84).....	13
Directionality of Radiation of Fan-Shaped Interdigital Surface Acoustic Wave Transducer (S. I. Koba; AKUSTICHESKIY ZHURNAL, No 5, Sep-Oct 83).....	13

Relation Between Lateral Displacement of Ultrasonic Beam and Coefficient of Attenuation of Normal Wave (Yu. B. Sviridov; AKUSTICHESKIY ZHURNAL, No 5, Sep-Oct 83).....	14
Polarization of Ultrasound Transmitted Through Boundary of Magnetically Inactive and Equatorially Magnetized Media (G. A. Babushkin; AKUSTICHESKIY ZHURNAL, No 5, Sep-Oct 83).....	14
Change in Propagation Direction of Surface Acoustic Waves With Help of Periodic Systems of Irregularities (Yu. Yu. Alyakna, V. P. Plesskiy; AKUSTICHESKIY ZHURNAL, No 5, Sep-Oct 83).....	15
Transient Acoustic Radiation by Mass Source Moving Over Uneven Surface (V. I. Pavlov, A. I. Sikhorukov; AKUSTICHESKIY ZHURNAL, No 5, Sep-Oct 83).....	15
Conditions for Optimal Absorption of Energy in Multilayered Resonant Systems (M. V. Krasil'nikov; AKUSTICHESKIY ZHURNAL, No 5, Sep-Oct 83).....	16
Spatial Correlation Function of Noise Field of Vibrational Velocity of Signal and Interference in Wedge (A. M. Karnovskiy; AKUSTICHESKIY ZHURNAL, No 5, Sep-Oct 83).....	16
Determining Gain of Acoustic Antenna Array From Pressure Measured in Fresnel Zone (V. L. Zemlyakov, S. G. Nikeshin; AKUSTICHESKIY ZHURNAL, No 5, Sep-Oct 83).....	17
Acoustic Attenuation Surfaces in Cubic Crystals (V. V. Lemanov, et al.; FIZIKA TVERDOGO TELA, No 4, Apr 84).....	17

CRYSTALS AND SEMICONDUCTORS

Effect of Liquid Phase Composition on Thickness of Epitaxial $Ga_{1-x}Al_xAs$ Films (N. F. Akbarov, et al.; IZVESTIYA AKADEMII NAUK UZ SSR: SERIYA FIZIKO-MATEMATICHESKIKH NAUK, No 1, Jan-Feb 84).....	18
Ionization as Factor Stimulating Recrystallization of Semiconductors (B. L. Oksengendler, et al.; IZVESTIYA AKADEMII NAUK UZ SSR: SERIYA FIZIKO-MATEMATICHESKIKH NAUK, No 1, Jan-Feb 84).....	18

Correlation Method for Measuring Noise in Semiconductor Radiation Detectors (P. K. Khabibullayev, et al.; IZVESTIYA AKADEMII NAUK UZ SSR: SERIYA FIZIKO-MATEMATICHESKIKH NAUK, No 1, Jan-Feb 84).....	19
Anomalous Magnetic Resistivity of Plastically Deformed Germanium (Yu. A. Zharikov, et al.; PIS'MA ZHURNAL EKSPERIMENTAL'NOY I TEORETICHESKOY FIZIKI, No 6, 25 Mar 84).....	19
Luminous Points and Breakdown in Structure of GaAs Transistors (S. G. Gasan-Zade, et al.; FIZIKA I TEKHNIKA POLUPROVODNIKOV, No 11, Nov 83).....	20
Composition of Metal Films on Gallium Arsenide Surface (V. G. Aleshin, et al.; DOKLADY AKADEMII NAUK SSSR, No 6, Dec 83).....	20
Effect of Negative Differential Conductivity in Quasi- Two-Dimensional Semiconductor Superlattices (A. A. Ignatov; DOKLADY AKADEMII NAUK SSSR, No 6, Dec 83).....	21
Tunnel Centers With Negative U and Photostimulated Reactions in Semiconductors (N. T. Bagrayev, V. A. Mashkov; PIS'MA V ZHURNAL EKSPERIMENTAL'NOY I TEORETICHESKOY FIZIKI, No 5, 10 Mar 84).....	21
Current-Voltage Characteristics of Diode Structures Based on Gallium Arsenide Compensated With Manganese or Iron (V. N. Gaman; IZVESTIYA VYSSHIKH UCHEBNYKH ZAVEDENIY: FIZIKA, No 10, Oct 83).....	22
Gallium Arsenide Avalanche S-Diodes (S. S. Khludkov; IZVESTIYA VYSSHIKH UCHEBNYKH ZAVEDENIY: FIZIKA, No 10, Oct 83).....	22
Deep Centers in Gallium Arsenide Associated With Intrinsic Structural Defects (B. I. Boltaks, et al.; IZVESTIYA VYSSHIKH UCHEBNYKH ZAVEDENIY: FIZIKA, No 10, Oct 83).....	23
Electron Structure of Deep Centers in Gallium Arsenide (V. F. Masterov; IZVESTIYA VYSSHIKH UCHEBNYKH ZAVEDENIY: FIZIKA, No 10, Oct 83).....	23

Impurity Trapping During Gas Phase Epitaxy of Gallium Arsenide (L. G. Lavrent'yeva; IZVESTIYA VYSSHIKH UCHEBNIKH ZAVEDENIY: FIZIKA, No 10, Oct 83).....	24
Nonequilibrium Trapping of Deep Centers During Liquid-Phase Epitaxy of Gallium Arsenide (Yu. B. Bolkhovitanov, et al.; IZVESTIYA VYSSHIKH UCHEBNIKH ZAVEDENIY: FIZIKA, No 10, Oct 83).....	24
Semiinsulating Gallium Arsenide for Microwave Electronics (M. G. Mil'vidskiy, et al.; IZVESTIYA VYSSHIKH ZAVEDENIY: FIZIKA, No 10, Oct 83).....	25
Problem of Deep Centers in Gallium Arsenide (A. F. Kravchenko; IZVESTIYA VYSSHIKH UCHEBNIKH ZAVEDENIY: FIZIKA, No 10, Oct 83).....	25
X-Ray Luminescence of LaF ₃ Single Crystals Activated With Nd and Pr (E. I. Zinin, et al.; ZHURNAL PRIKLADNOY SPEKTROSKOPII, No 2, Feb 84).....	25
Influence of Growing Conditions of Al _x Ga _{1-x} As-GaAs Heterostructure in MOS-AsH ₃ -H ₂ System on Parameters of Solar Cells (M. B. Kagan, et al.; ZHURNAL TEKHNIЧЕСКОY FIZIKI, No 1, Jan 84).....	26
Effect of Light Pulses on Film of Chalcogenide Vitreous Semiconductors (A. V. Kolobov, N. Sebast'yan; ZHURNAL TEKHNIЧЕСКОY FIZIKI, No 1, Jan 84).....	26
Spectral Behavior of Delay of Radiation of (GaAl)As Diodes (Yu. V. Popov, M. B. Trapeznikov; ZHURNAL TEKHNIЧЕСКОY FIZIKI, No 1, Jan 84).....	27
Field Relaxation in Waveguide Metal-Dielectric- Semiconductor Electroabsorption Optimal Modulator (A. V. Maksimov, et al.; ZHURNAL TEKHNIЧЕСКОY FIZIKI, No 1, Jan 84).....	27
Spectral Distribution of Radiation in p-n Junctions of GaAs During Avalanche Breakdown (B. M. Dzelme, et al.; IZVESTIYA AKADEMII NAUK LATVIYSKOY SSR: SERIYA FIZICHESKIKH I TEKHNIЧЕСKIKH NAUK, No 2, Mar-Apr 84).....	28

Kinetics of Oxidation and Change in State of Surface of Laser-Heated Metal Surface (V. A. Bovyrev, et al.; POVERKHNOST': FIZIKA, KHIMIYA, MEKHANIKA, No 4, Apr 84).....	28
Shock Ionization Coefficients of Electrons and Holes in Narrow-Band InAs Solid Solutions (I. A. Andreyev, et al.; FIZIKA I TEKHNIKA POLUPROVODNIKOV, No 3, Mar 84).....	29
Investigation of Local Irregularities in Photosensitivity and Luminescence of Chalcogenide Lead Films in Scanning Electron Microscope (V. I. Petrov, et al.; FIZIKA I TEKHNIKA POLUPROVODNIKOV, No 3, Mar 83).....	29
Complex Formation and Temperature Stability of Electrophysical Properties of GaAs Semiinsulating Single Crystals (A. V. Markov, et al.; FIZIKA I TEKHNIKA POLUPROVODNIKOV, No 3, Mar 84).....	30
Contribution of Different Trapping Centers to Polarization of Diamond Detectors for Ionizing Radiation (Yu. S. Mukhachev, et al.; FIZIKA I TEKHNIKA POLUPROVODNIKOV, No 3, Mar 84).....	30
Growth Rate of Microdestruction Sites in Alkali Halide Crystals Caused by CO ₂ Laser Pulses (V. P. Krutyakova, V. N. Smirnov; ZHURNAL TEKHNICHESKOY FIZIKI, No 2, Feb 84).....	31
Reversible Change in Parameters of GaAs-Based Surface- Barrier Metal-Semiconductor Diodes Induced by Hydrogen Absorption-Desorption (B. B. Kulihev, et al.; DOKLADY AKADEMII NAUK SSSR, No 3, Mar 84).....	31
Low-Threshold Stimulated Emission of Nd ³⁺ Ions in NaLuGeO ₄ (A. A. Kaminskiy, et al.; DOKLADY AKADEMII NAUK SSSR, No 3, Mar 84).....	31
Investigation of Critical Behavior of Permittivity of Heterogeneous Mixtures (A. P. Vinogradov, et al.; DOKLADY AKADEMII NAUK SSSR, No 3, Mar 84).....	32
Thin-Film (Al,Ga)As Heterojunction Solar Cells (V. I. Brynzar', et al.; PIS'MA V ZHURNAL TEKHNICHESKOY FIZIKI, No 8, 26 Apr 84).....	32

Intensity of Radiation During Axial Channeling of High Energy Particles in Thick Crystals (V. N. Bayyer, et al.; DOKLADY AKADEMII NAUK SSSR, No 6, Apr 84).....	33
Natural Birefringence in Cubic Crystals in Exciton Region of Spectrum (Ye. G. Tsitsishvili; DOKLADY AKADEMII NAUK SSSR, No 6, Apr 84).....	33
Impurities in Silicate Glass and Destruction of Glass by Strong Radiation (N. P. Novikov, et al.; INZHENERNO-FIZICHESKIY ZHURNAL, No 4, Apr 84).....	33
Strong-Current High Speed Commutator Based on GaAs Dynistor Structure (V. M. Botiaryuk, et al.; PIS'MA V ZHURNAL TEKHNICHESKOY FIZIKI, No 7, 12 Apr 84).....	34
Stoichiometric Single Crystals and Region of Homogeneity of Refractory Compounds (V. N. Gurin, et al.; FIZIKA TVERDOGO TELA, No 4, Apr 84).....	34
Formation of Lattice Defects by Nitrogen Laser Exposure in A_2B_6 Semiconductors With Wide Forbidden Band (G. P. Yablonskiy; FIZIKA TVERDOGO TELA, No 4, Apr 84).....	35
Low-Threshold Injection Lasers on Grown GaInPAs/InP Heterostructures (1.2-1.6 μm Wavelengths) (V. P. Avdeyeva, et al.; ZHURNAL TEKHNICHESKOY FIZIKI, No 3, Mar 84).....	35
Symmetry of Exchange Interaction in Crystalline Magnetic Films (A. Yu. Kozhukhar'; DOKLADY AKADEMII NAUK SSSR, No 1, Mar 84).....	36
Photoelectric Effect in Liquid Crystals (L. K. Vistin'; DOKLADY AKADEMII NAUK SSSR, No 1, Mar 84).....	37
Microcathodoluminescent Study of Phase Inhomogeneity in Yttrium-Aluminum-Garnet Singlecrystals (M. L. Meyl'man, et al.; DOKLADY AKADEMII NAUK SSSR, No 1, Mar 84).....	38

ELECTRICITY AND MAGNETISM

Excitation of Quasi-Static Magnetic Fields With Axial Structure (A. G. Karpenko, et al.; DOKLADY AKADEMII NAUK SSSR, No 2, Sep 83).....	39
Transformation of Heterogeneous Surface Waves by Skewed Streams (A. P. Yevdokimov; DOKLADY AKADEMII NAUK UKRAINSKOY SSR: SERIYA A, FIZIKO-MATEMATICHESKIYE I TEKHNIЧЕСKIYE NAUKI, No 3, Mar 84).....	39
Theory of Radio Wave Propagation Over the Ocean (A. G. Bugrov, et al.; DOKLADY AKADEMII NAUK SSSR, No 6, Apr 84).....	40

FLUID DYNAMICS

Gas Dynamics of Combustion of Gas-Air Mixture in Semi-Closed Space With Relief of Pressure Into Gasless Adjacent Space (P. A. Strel'chuk, et al.; FIZIKA GORENIYA I VZRYVA, No 1, Jan-Feb 84).....	41
Vibrational Relaxation Dynamics in Rapid-Flow Plasma Chemical Systems (I. A. Kirillov, et al.; KHIMIYA VYSOKIKH ENERGIY, No 2, Mar-Apr 84).....	41
Transition From Regular to Mach Reflection During Interaction Between Shock Wave and Solid Wall in Two-Phase Gas-Liquid Medium (A. V. Voloshinov, et al.; IZVESTIYA AKADEMII NAUK SSSR: MEKHANIKA ZHIDKOSTI I GAZA, No 5, Sep-Oct 83).....	42
Assessment of Influence of Three-Dimensional Effects on Development of Transient Concentration Natural Convection in Closed Region (I. N. Koroleva, et al.; IZVESTIYA AKADEMII NAUK SSSR: MEKHANIKA ZHIDKOSTI I GAZA, No 5, Sep-Oct 83).....	42
Influence of Distributed Injection of Polymer Solution on Characteristics of Turbulent Boundary Layer (V. A. Aleksin, et al.; IZVESTIYA AKADEMII NAUK SSSR: MEKHANIKA ZHIDKOSTI I GAZA, No 5, Sep-Oct 83).....	42

Estimation of Potential Part of Pressure Behind Shock Wave Front (V. A. Anisichkin; FIZIKA GORENIYA I VZRYVA, No 1, Jan-Feb 84).....	43
Characteristics of Interaction of Explosive Waves From Spherical Deflagration With Obstacle (S. A. Bystrov, V. A. Gorev; FIZIKA GORENIYA I VZRYVA, No 1, Jan-Feb 84).....	43
Influence of Composition of Combustible Gas Mixture on Parameters of Plane Shock Wave Generated During Explosion in Air (A. P. Voytov, et al.; FIZIKA GORENIYA I VZRYVA, No 1, Jan-Feb 84).....	44
Shock Wave Propagation in Air Suspension of Solid Particles (T. P. Gavrilenko, V. V. Grigor'yev; FIZIKA GORENIYA I VZRYVA, No 1, Jan-Feb 84).....	44
Transition From Explosion to Detonation in Porous Explosives (I. Sh. Akhatov, P. B. Vaynshteyn; FIZIKA GORENIYA I VZRYVA, No 1, Jan-Feb 84).....	44
Developed Turbulent Flow Under Conditions of Internal and External Problems (R. F. Galimzyanov; ZHURNAL TEKHNIЧЕСКОY FIZIKI, No 1, Jan 84).....	45
Interferometric Investigation of Escape of Viscous Gas From Slot and Cylindrical Channels Into Space With Low Pressure (V. G. Maslennikov; ZHURNAL TEKHNIЧЕСКОY FIZIKI, No 1, Jan 84).....	45
Hydrodynamic Loads on Gates in Automatic Antiflooding System (E. E. Makovskiy, L. N. Skorokhodova; IZVESTIYA AKADEMII NAUK KIRGIZSKOY SSR, No 1, Jan-Feb 84).....	46
Investigation of Screening of Radiation Thermal Flux by Injection of Products of Destruction of Asbestos Plastic in Hypersonic Flow Around Sphere (A. V. Gudzovskiy, T. V. Kondranin; INZHENERGO-FIZICHESKIY ZHURNAL, No 2, Feb 84).....	46
Experimental Investigations of Developing Flow in Square Channel Rotating About Transverse Axis (A. V. Kuz'minskiy, et al.; INZHENERNO- FIZICHESKIY ZHURNAL, No 4, Oct 84).....	47

Laminar-to-Turbulent Flow Transition Under Influence of Acoustic Oscillations (A. N. Shel'pyakov, et al.; INZHENERNO- FIZICHESKIY ZHURNAL, No 4, Oct 83).....	47
Propagation of Gas Jet in Liquid (V. A. Surin, et al.; INZHENERNO-FIZICHESKIY ZHURNAL, No 4, Oct 83).....	47
Problem of Reduction to Ideal Wind Tunnel in Experimental Aerodynamics (N. N. Yanenko, et al.; DOKLADY AKADEMII NAUK SSSR, No 6, Feb 84).....	48
Experimental Study of Mach Reflection of Weak Shock Waves (G. A. Makarevich, et al.; ZHURNAL TEKHNIЧЕСКОY FIZIKI, No 3, Mar 84).....	49
Electrical Conductivity Profiles in Gases During Detonation (A. V. Pinayev, A. I. Sychev; DOKLADY AKADEMII NAUK SSSR, No 1, Mar 84).....	49

LASERS AND MASERS

Numerical Analysis of Parameters of Self-Heating Copper Vapor Lasers (A. F. Galkin, et al.; TEПЛОФИЗИКА VYSOKIKH TEMPERATUR, No 5, Sep-Oct 83).....	51
248 nm - New Short Wavelength for Pumping Lasers Employing Vapors of Complex Molecules (V. V. Gruzinskiy, et al.; IZVESTIYA VYSSHIKH UCHEBNYKH ZAVEDENIY: FIZIKA, No 4, Apr 84).....	51
Use of Alkali Halide Crystal Color Centers for Passive Mode Locking of YAG:Nd Lasers (M. I. Demchuk, et al.; PIS'MA V ZHURNAL TEKHNIЧЕСКОY FIZIKI, No 6, 26 Mar 84).....	52
Tunable Dye Laser Producing Single Ultrashort Pulse (L. Kh. Miradyan, et al.; ZHURNAL PRIKLADNOY SPEKTROSKOPII, No 2, Feb 84).....	52
Thermal Effect of Laser Radiation on Layered Tissues of the Eye (A. S. Podol'tsev, G. I. Zheltov; ZHURNAL PRIKLADNOY SPEKTROSKOPII, No 2, Feb 84).....	53
High-Efficiency Chromium-Ytterbium-Erbium Phosphate Glass Laser (Yu. D. Berezin, et al.; ZHURNAL PRIKLADNOY SPEKTROSKOPII, No 2, Feb 84).....	53

Tunable Lasers and Laser Spectral Devices Employing Acousticoptical Filters (M. F. Stel'makh, et al.; ZHURNAL PRIKLADNOY SPEKTROSKOPII, No 2, Feb 84).....	53
Self-Modulation of Injection Laser Emission Intensity Due to External Optical Feedback (B. I. Smiyan, et al.; ZHURNAL TEKHNIЧЕСКОY FIZIKI, No 1, Jan 84).....	54
Laser Processing of Objects With Simultaneous Visual Monitoring in Copper-Vapor Laser-Amplifier System (K. I. Zemskov, et al.; KVANTOVAYA ELEKTRONIKA, No 2 (140), Feb 84).....	54
Investigating of Mixing D ₂ -CO ₂ -GDL (K. P. Alekseyev, et al.; KVANTOVAYA ELEKTRONIKA, No 2, (140), Feb 84).....	55
Influence of Translational and Hyperfine Relaxation on Energy Characteristics of Oxygen-Iodine Laser (M. V. Zagidullin, et al.; KVANTOVAYA ELEKTRONIKA, No 2 (140), Feb 84).....	55
Du ₈₁ (GaAl) As-Heterostructure Based Injection Laser Traveling Wave Amplifier (I. S. Gondobin, et al.; KVANTOVAYA ELEKTRONIKA, No 2 (140), Feb 84).....	56
Transient Optical Nutation in CO ₂ Laser (V. Yu. Baranov, et al.; KVANTOVAYA ELEKTRONIKA, No 2 (140), Feb 84).....	56
Optical Recording of Information on Paper by CO ₂ and YAG-Lasers (S. G. Bayev, et al.; KVANTOVAYA ELEKTRONIKA, No 2 (140), Feb 84).....	57
Distribution of Electromagnetic Field and Gain in Flat Resonator of CO ₂ GDL With Large Fresnel Numbers (A. V. Butkovskiy, G. Ya. Dynnikova; KVANTOVAYA ELEKTRONIKA, No 2 (140), Feb 84).....	57
Inversion Accumulation in Active Medium of Iodine Lasers in Presence of Irregular Magnetic Fields (B. D. Bobrov, et al.; KVANTOVAYA ELEKTRONIKA, No 2 (140), Feb 84).....	58
Solar-Pumped Lasers (A Review) (A. L. Golger, I. I. Klimovskiy; KVANTOVAYA ELEKTRONIKA, No 2 (140), Feb 84).....	58

Spectrally Matched Modulation of Radiation of Injection Laser in Traveling-Wave Amplifier Below 2 GHz (D. M. Annenkov, et al.; KVANTOVAYA ELEKTRONIKA, No 2 (140), Feb 84).....	59
Optimization of Ultrashort Pulse Generation Mode of YAG Laser (M. I. Demchuk, et al.; IZVESTIYA AKADEMII NAUK SSSR: SERIYA FIZICHESKAYA, No 3, Mar 84).....	59
Pulse-Periodic YAG:Nd ³⁺ Active Mode-Locked Laser With Intracavity Frequency Doubling (P. A. Apanasevich, et al.; IZVESTIYA AKADEMII NAUK SSSR: SERIYA FIZICHESKAYA, No 3, Mar 84).....	60
Nonlinear Effects During Interaction of Picosecond Laser Pulses With Group A ₂ B ₆ Wide-Band Conductors (V. P. Gribkovskiy, V. A. Zyl'kov; IZVESTIYA AKADEMII NAUK SSSR: SERIYA FIZICHESKAYA, No 3, Mar 84).....	60
Formation of Single Femtosecond Light Pulses at Modulation Frequency in Passive Mode-Locked Lasers (W. Dietel, et al.; IZVESTIYA AKADEMII NAUK SSSR: SERIYA FIZICHESKAYA, No 3, Mar 84).....	61
Theory of Free-Electron Lasers With Focusing Pumping Field (N. S. Ginsburg; ZHURNAL TEKHNIЧЕСКОY FIZIKI, No 2, Feb 83).....	61
Investigation of Electrooptical Systems of Relativistic Electron Masers (I. Ye. Botvinnik, et al.; ZHURNAL TEKHNIЧЕСКОY FIZIKI, No 2, Feb 84).....	62
Segmented Metal Discharge Tubes for Longitudinal-Discharge Ultraviolet Nitrogen Lasers (V. G. Il'yusho, et al.; PRIBORY I TEKHNIKA EKSPERIMENTA, No 1, Jan-Feb 84).....	62
Multifrequency Lidar Based on Dye Laser (L. D. Ganushkina, et al.; ZHURNAL PRIKLADNOY SPEKTROSKOPII, No 4, Apr 84).....	62
Narrowband Tunable Dye Laser With Amplifier Pumped by Powerful Nitrogen Laser (S. N. Dorofeyev, et al.; ZHURNAL PRIKLADNOY SPEKTROSKOPII, No 4, Apr 84).....	63
Biaxial-Crystal Laser With Waveguide Resonator (B. B. Boyko, et al.; ZHURNAL PRIKLADNOY SPEKTROSKOPII, No 4, Apr 84).....	63

Influence of Heat Treatment of Aluminum Alloy Foil on Results of Laser Quantometric Analysis (Ye. P. Safonova, et al.; ZHURNAL SPEKTROSKOPII, No 4, Apr 84).....	64
InGaAsP/InP Injection Lasers Employing Three-Layer Waveguide (M. G. Vasil'yev, et al.; KVANTOVAYA ELEKTRONIKA, No 3, Mar 84).....	64
External Cavity With Nonlinear Thermal Filling (D. V. Vlasov, V. N. Strel'tsov; KVANTOVAYA ELEKTRONIKA, No 3, Mar 84).....	65
Subpicosecond Neodymium Phosphate Glass Laser (B. Bareyka, et al.; KVANTOVAYA ELEKTRONIKA, No 3, Mar 84).....	65

ACOUSTICS

UDC 534.232.535.3

RADIATION-COLLISION SOUND SOURCE

Moscow KVANTOVAYA ELEKTRONIKA in Russian Vol 11, No 3, Mar 84
(manuscript received 15 Apr 83) pp 510-519

GEL'MUKHANOV, F. Kh., Institute of Automation and Electrometry, Siberian
Department, USSR Academy of Sciences

[Abstract] The generation of sound based on the light-induced draft phenomenon is investigated within the framework of a thirteen-moment Grad approximation. Kinetic equations are derived that describe the interaction of radiation with a gas in field-linear approximation. The acoustic oscillations are found to be quasistationary microscopically. The generation of sound in a gas enclosed in a cylindrical resonator and in a radiation-collision antenna is investigated. A mechanism underlying sound generation is proposed in which the vibration amplitude is a function of the sign of the mismatch, making it possible to eliminate the sound masking the thermal excitation effect. References 10: 9 Russian, 1 Western.

CHARACTERISTICS OF IMPULSE ACOUSTOOPTICAL EFFECT IN GASES

Leningrad ZHURNAL TEKHNICHESKOY FIZIKI in Russian Vol 54, No 2, Feb 84
(manuscript received 16 Feb 83) pp 342-347

VERESHCHAGINA, L. N., ZHAROV, V. P., SHIPOV, G. I. and SHTEPA, V. I., Moscow
State University imeni M. V. Lomonosov

[Abstract] A rigorous solution is found for the problem of the formation of pulsed acoustooptical signals in the chamber of a gas measurement cell. A theoretical model of the gas cell is constructed, and it is shown that two types of acoustooptical signals are formed simultaneously due to thermodynamic heating of the gas and the resonant acoustic properties of the medium in the cell. Simple methods are proposed for extracting one type of signal alone. References 8: 7 Russian, 1 Western.

DETERMINATION OF FREQUENCY CHARACTERISTICS OF IMPEDANCE OF THREE-DIMENSIONAL ACOUSTIC ELEMENTS BY GEOMETRIC CONSTRUCTION METHOD

Yerevan IZVESTIYA AKADEMII NAUK ARMYANSKOY SSR: SERIYA TEKHNICHESKIKH NAUK in Russian Vol 37, No 1, Jan-Feb 84 (manuscript received 28 Oct 83) pp 20-24

BORISOV, L. A. and GASPARYAN, Yu. A., Yerevan Polytechnical Institute imeni K. Marx

[Abstract] A method is proposed for determining the input impedance of a nonspherical three-dimensional element in which measurements are taken for a narrow range of frequencies and the impedance frequency response is then constructed throughout the entire frequency range. It is demonstrated possible to use geometric impedance constructions to analyze the acoustic absorption characteristics of a broad class of three-dimensional elements with complex structures. References 3 Russian.

SURFACE ACOUSTIC WAVE ATTENUATION IN PIEZOELECTRICS DURING INTERACTION WITH PLASMA GAS DISCHARGE

Leningrad PIS'MA V ZHURNAL TEKHNICHESKOY FIZIKI in Russian Vol 10, No 6, 26 Mar 84 (manuscript received 11 Jan 84) pp 371-374

DOBROVOL'SKIY, A. A., LEMANOV, V. V., MAKARENKO, V. A., MARTSINOVSKIY, A. M., and SHERMAN, A. B.

[Abstract] The interaction of surface acoustic waves with electrons and ions of a plasma with Maxwellian energy distribution is investigated by placing the crystal in the positive discharge column. The relationship between surface acoustic wave attenuation and electron concentrations in the plasma is given for discharges in argon and in air; wave attenuation is shown as a function of the acoustic power in the wave for different electron concentrations for an argon discharge. In argon, the attenuation first increases rather rapidly with concentration, after which it drops off and then increases again. The initial rapid increase in attenuation is less clear in air, but the increase becomes sharp in the region of high concentrations. The amount of attenuation for air in the same region is 3 to 4 times lower than for argon. Figure 1, references 3 Russian.

SCATTERING OF PLANE WAVE ON CYLINDRICAL SHELL IN LOW-FREQUENCY REGION

Moscow AKUSTICHESKIY ZHURNAL in Russian Vol 30, No 2, Mar-Apr 84
(manuscript received 23 Jul 82) pp 253-258

PANIKLENKO, A. P. and RYBAK, S. A., Acoustics Institute imeni M. M. Andreyev,
USSR Academy of Sciences

[Abstract] The scattering amplitude of a plane wave striking an infinite cylindrical shell at an arbitrary angle in the low frequency region is analyzed. It is found that resonant properties of an infinite cylindrical shell in water will be observed in the scattered field only for shells with thickness of $h/R \geq 4 \cdot 10^{-2}$ (for steel). No resonance will be noted in the scattered field for inner shells. The introduction of additional losses reduces the scattering amplitude at resonance, and the resonance properties become significant as the shell becomes thicker. References 5: 4 Russian, 1 Western.

STATISTICS OF BEAM ARRIVING AT ASSIGNED POINT IN HETEROGENEOUS MEDIUM WITH FLUCTUATING PARAMETERS

Moscow AKUSTICHESKIY ZHURNAL in Russian Vol 30, No 2, Mar-Apr 84
(manuscript received 11 Nov 82) pp 243-248

MOISEYEV, A. A., Institute of Oceanology imeni P. P. Shirshov, USSR Academy of Sciences

[Abstract] The statistical characteristics of geometric optical beams connecting two preassigned points, a source and a receiver, in a random heterogeneous medium as investigated. The submersion method is used to state the Cauchy problem employed to find the distribution functions of the spatial coordinates and angle of inclination of the beams. The formulas derived are obtained in Markov approximation and assume gaussian quasiuniform fluctuations of the medium. The formulas derived are used to examine the statistics of an acoustic beam propagating in a stratified ocean with statistically uniform and isotropic fluctuations of the index of refraction for a source and receiver located on the axis of an underwater acoustic channel. The results can also be used to calculate space fluctuations of a signal in a random heterogeneous medium by the geometric optics method. References 8 Russian.

SPACE-TIME CORRELATION OF NARROWBAND NOISE SIGNAL IN SHALLOW OCEAN

Moscow AKUSTICHESKIY ZHURNAL in Russian Vol 30, No 2, Mar-Apr 84
(manuscript received 10 Sep 82) pp 233-237

KUDRYASHOV, V. M., Acoustic Institute imeni N. N. Andreyev, USSR Academy of Sciences

[Abstract] The space-time correlation of a narrowband noise signal in a shallow ocean is investigated. It is demonstrated that the duration of the delay correlation function varies in proportion to the distance if the existing composition of the normal waves remains unchanged as the distance between the corresponding points changes. Singularities are demonstrated in the space-time variability of the normalized correlation function due to the fact that the coefficients of attenuation of normal waves in a shallow ocean differ for waves with different numbers. The correlation function of narrowband noise is shown to depend on the correlation coefficient of the radiated signal, the position of the observation points, the waveguide dispersion and the coefficient of attenuation of the normal waves. Figures 4, references 3 Russian.

REORIENTATION OF MAGNETIC MOMENTS OF ANTIFERROMAGNETS IN ACOUSTIC WAVE FIELD

Moscow AKUSTICHESKIY ZHURNAL in Russian Vol 30, No 2, Mar-Apr 84
(manuscript received 4 Oct 82) pp 230-232

KOYRAKH, L. A. and PREOBRAZHENSKIY, V. L., Moscow State University of Electrical Engineering, Electronics and Automation

[Abstract] The processes underlying nonlinear interaction of elastic waves in antiferromagnets with "easy plane" type anisotropy are analyzed within the framework of nonlinear motion equations for the antiferromagnetism vector. Dynamic equilibrium states of the magnetic subsystem exposed to a powerful acoustic wave are analyzed. The conditions for the occurrence of homogeneous static fields are identified for different propagation directions. It is found that new stable equilibrium states can occur in the magnetic and elastic subsystem due to nonlinearity of the magnetoelastic interaction. References 8: 7 Russian, 1 Western.

INFLUENCE OF RANDOM FIELD OF INTERNAL WAVES ON ACOUSTIC PROPAGATION IN THE OCEAN

Moscow AKUSTICHESKIY ZHURNAL in Russian Vol 30, No 2, Mar-Apr 84
(manuscript received 1 Oct 82) pp 183-191

GORSKAYA, N. S. and RAYEVSKIY, M. A., Institute of Applied Physics, USSR Academy of Sciences

[Abstract] The transformation of acoustic wave energy by modes is examined for a real internal wave field with allowance for waveguide losses. Attenuation of the coherent component of the acoustic wave and the variation in a singular spectrum are studied. Losses of low-frequency sound energy due to pumping from modes localized in the waveguide to modes that attenuate on the ocean floor are investigated. These effects are shown to be important in studying sound propagation in the ocean. References 9: 4 Russian, 5 Western.

EFFECTIVENESS OF WAVE VIBRATION-ABSORBING COATING OF RIBBED ROD

Moscow AKUSTICHESKIY ZHURNAL in Russian Vol 30, No 2, Mar-Apr 84
(manuscript received 27 Oct 82) pp 259-266

STEPANOV, V. B. and TARTAKOVSKIY, B. D., Acoustics Institute imeni N. N. Andreyev, USSR Academy of Sciences

[Abstract] The effectiveness of a wave coating applied to a rod with rigid transverse ribs is analyzed. It is found that the deformation of the coating increases due to the ribs, resulting in increased attenuation of vibrations in the rod at frequencies below the primary resonance of the coating. When the wave thickness of the coating is small, damping effectiveness increases due to shear deformations in the coating caused by the rigid connection with the rib. Figures 5, references 7: 6 Russian, 1 Western. [224-6900]

ESTABLISHMENT OF FORCED OSCILLATIONS IN ACOUSTIC RESONATORS

Moscow AKUSTICHESKIY ZHURNAL in Russian Vol 30, No 2, Mar-Apr 84
(manuscript received 30 Aug 82) pp 204-212

GUSEV, V. E., Moscow State University imeni M. V. Lomonosov

[Abstract] Simple general equations are derived to describe weakly nonlinear standing waves excited by the oscillations of a piston in a closed tube that vary slowly over time and through space. The mathematical apparatus developed is effective for studying the processes underlying the excitation of standing waves, which corresponds to the most frequently encountered experimental situation. The analytical method is fairly simple, and should be applicable to more complex physical problems. Figures 3, references 16: 11 Russian, 5 Western.

SLOWLY ROTATING PULSED RADIATION SOURCE

Moscow AKUSTICHESKIY ZHURNAL in Russian Vol 30, No 2, Mar-Apr 84
(manuscript received 18 Oct 82) pp 238-242

LEVKOVSKIY, Yu. L.

[Abstract] An approximate analytical solution is obtained for the problem of a rotating monopole such as a propellor, pump vane fan or other bladed mechanism. The radiation is assumed to be pulsed, i.e., occurring in the part of the circular trajectory that a pulse follows. The amplitude of the induced pressure when the sector within which the source radiates is small is found to be independent of the parameter L , which corresponds to the assumption of an incompressible liquid. An example is presented that illustrates the advantage of the approximate solution. References 4: 3 Russian, 1 Western.

MUTUAL SPECTRUM OF RADIATED NOISE SIGNAL AND SIGNAL REFLECTED FROM STRATIFIED OCEAN FLOOR

Moscow AKUSTICHESKIY ZHURNAL in Russian Vol 30, No 1, Jan-Feb 84
(manuscript received 30 Jul 82) pp 137-139

KRASNOBOROD'KO, V. V., Institute of Oceanology imeni P. P. Shirshov, USSR
Academy of Sciences

[Abstract] The spectral-correlation characteristic of noise signals scattered from the floor and surface of an ocean are analyzed. The cross-correlation function of the radiated noise signal and the signal reflected from the ocean floor is analyzed. The mutual spectrum of the radiated noise signal and that reflected from the stratified ocean floor is calculated and analyzed. It is found that the presence of strata in the floor causes the mutual spectrum to change significantly. The appearance of interference bands in the phase component of the mutual spectrum is found to be associated with reflection at two or more boundaries. References 2: 1 Russian, 1 Western.

PARAMETRIC EXCITATION OF TRANSVERSE SLOT ACOUSTIC WAVES IN SOLID BODIES BY MICROWAVE ELECTRICAL FIELD

Moscow AKUSTICHESKIY ZHURNAL in Russian Vol 30, No 1, Jan-Feb 84
(manuscript received 22 Jul 82) pp 132-134

BONDARENKO, T. I. and BURLAK, G. N., Kiev State University imeni T. G. Shevchenko

[Abstract] It is demonstrated that a high frequency electrical pumping field with frequency ω_p can generate transverse acoustic waves with frequency Ω that propagate along the boundary of two electrostriction crystals. Parametric resonance of colliding acoustic waves at frequencies Ω and $-\Omega + 2\omega_p$ is shown to occur when the frequencies of the field and the acoustic waves are the same. Numerical analysis reveals that the spectrum of transverse slot surface acoustic waves in semi-bounded crystals in a microwave electric field has a zone in which transmission is impeded in the region of parametric instability. ANALYSIS OF HORIZONTAL REFRACTION OF ACOUSTIC WAVES IN SHALLOW OCEAN BY
PERTURBATION METHOD

Moscow AKUSTICHESKIY ZHURNAL in Russian Vol 30, No 1, Jan-Feb 84
(manuscript received 24 Jul 82) pp 79-82

KRAVTSOV, Yu. A., KUZ'KIN, V. M. and PEPNIKOV, V. G., Physics Institute imeni
P. N. Lebedev, USSR Academy of Sciences

[Abstract] Variations in the angles of arrival of acoustic waves are analyzed on the basis of perturbation theory for horizontal waves. Simple quadrature formulas are obtained for the refraction angles in the horizontal plane, as well as for the group delays. The perturbation method is employed in a form suitable for horizontal waves corresponding to adiabatic normal waves in a heterogeneous shallow ocean. Examples are cited that demonstrate the method. Perturbation theory is found to provide convenient analytic expressions for the variations in the angles of horizontal refraction and group delay that relate the measured angles of arrival and delays to the ocean parameters. Figure 1, references 9: 8 Russian, 1 Western.

DIRECTIONALITY OF RADIATION OF FAN-SHAPED INTERDIGITAL SURFACE ACOUSTIC WAVE TRANSDUCER

Moscow AKUSTICHESKIY ZHURNAL in Russian Vol 29, No 5, Sep-Oct 83
(manuscript received 20 Apr 82) pp 708-710

KOBA, S. I.

[Abstract] An error is identified in a previous study of the amplitude distribution of a surface acoustic wave over the aperture of a fan-shaped interdigital transducer [A. B. Karro-Est, V. V. Polyakov, A. N. Rozhdestvenskiy, "Directionality of Radiation of Fan-Shaped Interdigital Surface Acoustic Wave Transducer", AKUSTICHESKIY ZHURNAL, Vol 27, No 4, 1981, pp 620-623]. It is shown that the error results in an estimate of the width of the first acoustic bundle according to the first zeros of the amplitude function that is actually half that indicated in the previous study. The figures yielded by the corrected formula agree well with measurements of the amplitude and phase of a surface acoustic wave along the aperture of a fan-shaped interdigital transducer. Figures 1, references 2 Russian. [281-6900]

RELATION BETWEEN LATERAL DISPLACEMENT OF ULTRASONIC BEAM AND COEFFICIENT OF ATTENUATION OF NORMAL WAVE

Moscow AKUSTICHESKIY ZHURNAL in Russian Vol 29, No 5, Sep-Oct 83
(manuscript received 22 Sep 81) pp 715-716

SVIRIDOV, Yu. B., Institute of Mathematics, Computer Center, Moldavian SSR Academy of Sciences

[Abstract] The relation between lateral displacement of an ultrasonic beam and the coefficient of attenuation of the normal wave excited by that beam on a liquid-solid phase interface is investigated. A study is performed for the case in which the coefficient of attenuation of a normal wave is significantly smaller than its propagation constant due to radiation in the liquid. Formulas are derived for the wave number of surface and normal waves by the perturbation method. The formula for the wave number of the surface wave can be used to find the coefficient of attenuation of a surface wave from the measured amount of lateral displacement of the beam. References 10: 6 Russian, 4 Western.

POLARIZATION OF ULTRASOUND TRANSMITTED THROUGH BOUNDARY OF MAGNETICALLY INACTIVE AND EQUATORIALLY MAGNETIZED MEDIA

Moscow AKUSTICHESKIY ZHURNAL in Russian Vol 29, No 5, Sep-Oct 83
(manuscript received 15 Mar 82) pp 702-704

BABUSHKIN, G. A., Institute of Metallurgy, Urals Scientific Center, USSR Academy of Sciences

[Abstract] The polarization of all types of elastic waves passing through the interface of a nonmagnetic medium and an equatorially magnetized medium is investigated as a function of the angle of incidence of the wave on the boundary and the nature of hypotrophy of the second medium. The hypotrophy of the medium is determined phenomenologically through the effective anti-symmetrical components of the tensor of the moduli of elasticity. These components are a function of the field H and the ultrasound frequency ω , and characterize the change in velocity and absorption of elastic waves in the magnetic field. The ellipticity and orientation of major axes of ellipses of polarization are investigated with respect to the refraction vectors. The findings are valid (disregarding spatial dispersion of the moduli of elasticity) for elastic isotropic crystals, polycrystals, and hexagonal crystals magnetized along the principal crystallographic axis when ultrasound propagates perpendicular to the axis. Reference 1 Russian.

CHANGE IN PROPAGATION DIRECTION OF SURFACE ACOUSTIC WAVES WITH HELP OF PERIODIC SYSTEMS OF IRREGULARITIES

Moscow AKUSTICHESKIY ZHURNAL in Russian Vol 29, No 5, Sep-Oct 83
(manuscript received 14 Jun 82) pp 700-702

ALYAKNA, Yu. Yu. and PLESSKIY, V. P., Institute of Electric Engineering
Electronics, USSR Academy of Sciences

[Abstract] The reflection of Rayleigh surface acoustic waves from a periodic lattice with irregularities arranged at an arbitrary angle $\pi/2 - \theta$ to the edge of the lattice is examined. The amplitude in this case is constant on the line $y=0$, rather than along the channels, so that the structure of the waves and the dispersion equation are different than for the case in which the amplitude is constant along the channels. Expressions are derived to express the wave vectors for the incident and reflected waves in the region of the lattice. The results make it possible to calculate the reflection of surface acoustic waves from a bounded lattice by using only the elastic constants of the material and the geometry of the array. Figures 2, references 3 Russian. [281-6900]

TRANSIENT ACOUSTIC RADIATION BY MASS SOURCE MOVING OVER UNEVEN SURFACE

Moscow AKUSTICHESKIY ZHURNAL in Russian Vol 29, No 5, Sep-Oct 83
(manuscript received 19 May 82) pp 673-677

PAVLOV, V. I. and SUKHORUKOV, A. I., Department of Acoustics, Moscow State University imeni M. V. Lomonosov

[Abstract] Quantitative characteristics of acoustic wave radiation occurring during the movement of a mass (or heat) source in a homogeneous medium near an uneven surface are obtained. Subsonic movement of the source, for which there is no Vavilov-Cherenkov radiation is examined, and the heterogeneity of the medium is the sole cause for the occurrence of radiation. A system of equations is derived for describing the movement of the medium. Radiation patterns for a number of characteristic parameters are presented. The pressure amplitudes, like the total radiation intensity, are very sensitive to the choice of parameters. Figures 3, references 4 Russian. [281-6900]

CONDITIONS FOR OPTIMAL ABSORPTION OF ENERGY IN MULTILAYERED RESONANT SYSTEMS

Moscow AKUSTICHESKIY ZHURNAL in Russian Vol 29, No 5, Sep-Oct 83
(manuscript received 5 Apr 82) pp 625-630

KRASIL'NIKOV, M. V., Institute of Electrical Engineering and Electronics,
USSR Academy of Sciences

[Abstract] A multilayered interference wave energy absorber type system is examined. The integral characteristics are analyzed on the basis of a slowly-varying amplitude method. The structures of the traveling wave fields are analyzed in resonators consisting of alternating layers of two media with similar acoustic properties, plus a slightly absorbing working layer. The slowly-varying amplitude method makes it possible to follow the distribution of the absolute values of the amplitudes of the direct and reverse waves in the system, makes the calculation significantly easier and provides a clearer picture of the processes occurring in multilayer resonant systems, including the capability of observing the propagation of the direct and return waves in the system. It can also be used to calculate the standing wave field in analogous wave systems. Figures 2, references 11 Russian.

SPATIAL CORRELATION FUNCTION OF NOISE FIELD OF VIBRATIONAL VELOCITY OF SIGNAL AND INTERFERENCE IN WEDGE

Moscow AKUSTICHESKIY ZHURNAL in Russian Vol 29, No 5, Sep-Oct 83
(manuscript received 25 Nov 80; revised 9 Mar 82) pp 619-624

KARNOVSKIY, A. M.

[Abstract] The spatial correlation function of the fluctuating signal and interference field, as well as the signal/interference ratio, are determined in a wedge-shaped waveguide. The signal field is assumed to be created by a local source, and the interference field is created by a set of local sources located within the wedge. The spatial correlation functions of the signal and interference are defined, and the signal/interference ratio in the acoustic field of each component of the vibrational velocity is calculated. The findings can be used to synthesize and analyze combined optimal space-time processing channels for vector and scalar acoustic signals in a wedge-shaped waveguide, and are also suitable for optimization in orienting a space processing channel within a waveguide. Figures 2, references 11 Russian.

DETERMINING GAIN OF ACOUSTIC ANTENNA ARRAY FROM PRESSURE MEASURED IN FRESNEL ZONE

Moscow AKUSTICHESKIY ZHURNAL in Russian Vol 29, No 5, Sep-Oct 83
(manuscript received 30 Apr 81; revised 21 Apr 82) pp 615-618

ZEMLYAKOV, V. L. and NIKESHIN, S. G.

[Abstract] A method is described for determining the gain of an antenna array from pressure measurements in the Fresnel zone by using beam expansion of the spherical wave created by the antenna. The proposed method is unusual in that a system of equations was used to determine the gain. The gain of a model of a linear antenna array consisting of 9 omnidirectional elements is analyzed as an example. The results indicate the possibility of employing the formulas derived to determine the gain of an acoustic array from the pressure measured in the Fresnel zone. Figures 4, references 9 Russian.

TURSUNOV, M. N., Physico-technical Institute imeni S. V. Starodubtsev, UzSSR
Academy of Sciences

[Abstract] The quality of the GaAs-AlAs heterojunction system multilayer structures can be improved by precise control of the thickness of the $\text{Ga}_{1-x}\text{Al}_x\text{As}$ layers and optimization of their parameters. An experimental study was made of the dependence of the thickness of the $\text{Ga}_{1-x}\text{Al}_x\text{As}$ layer on the aluminum content of the liquid phase of the growth process at temperature levels of 920, 870, 820°C on gallium arsenide bases. Increase in solution aluminum content from zero to 2 at.% led to a fall in film thickness by a factor of 2.5-3. Anisotropy of epitaxial growth was not observed. Thickness can thus be controlled by modulating aluminum content. By utilizing a limited volume of heavy solution it is possible to obtain prescribed layer thicknesses. Figure 1, references 5 Russian.

IONIZATION AS FACTOR STIMULATING RECRYSTALLIZATION OF SEMICONDUCTORS

Tashkent IZVESTIYA AKADEMII NAUK UZ SSR: SERIYA FIZIKO-MATEMATICHESKIKH NAUK
in Russian No 1, Jan-Feb 84 (manuscript received 22 Jun 82) pp 45-48

OKSENGENDLER, B. L., PAKHARUKOV, Yu. V. and YUNUSOV, M. S., Institute of
Nuclear Physics, UzSSR Academy of Sciences

[Abstract] Electron excitation is known to play a part in laser, electron and ion recrystallization but there is insufficient data as to the effectiveness of the various types of atomic reorganization and the study considers the role of ionization in stimulating large-scale processes. The transition of a metastable amorphous semiconductor to a stable crystalline state is considered.

Ionization transfers electrons from the valence band to the conduction band which modifies the dissociation energy of the crystalline and amorphous phases. Formation of single crystal nuclei in the amorphous semiconductor is determined by energy relations and barriers and as excitation increases in the two phases the energy characteristics move together. Ionization can also affect the thermodynamically determined stability of the interphase boundary and can produce a transformation of amorphous to single crystal states. Numerical calculations evaluated the effectiveness of the two phase transformation states and showed that interphase boundary variation was less effective than the nucleus formation barrier modification mode which is also probably responsible for experimentally observed partial polycrystalline recrystallization. CORRELATION METHOD FOR MEASURING NOISE IN SEMICONDUCTOR RADIATION DETECTORS

Tashkent IZVESTIYA AKADEMII NAUK UZ SSR: SERIYA FIZIKO-MATEMATICHESKIKH NAUK in Russian No 1, Jan-Feb 84 (manuscript received 15 Jan 82) pp 39-41

KHABIBULLAYEV, P. K., MURATOV, A. F., POD"YACHEV, V. N. and TATEOSOV, V. G., Tashkent

[Abstract] Improved semiconductor technology has made it possible to considerably reduce noise in X-ray and soft gamma-ray detectors. Detector noise values must be measured to estimate semiconductor quality, evaluate production characteristics and series produced instrument design and to measure input parameters and effects of external conditions on detector noise level. A new method is proposed for measuring detector noise and that of similar bipolar devices by means of field-effect transistors used as input stages for two charge-sensitive preamplifiers linked to the current-generating detector. A correlation device then makes it possible to discriminate detector noise. The method can measure noise an order of magnitude less than the detector noise and only a relatively low level of instrumental stability is required. It has been applied to series produced detection instruments such as radiation units operating at cryogenic temperatures. Figure 1, references 3 Russian.

ANOMALOUS MAGNETIC RESISTIVITY OF PLASTICALLY DEFORMED GERMANIUM

Moscow PIS'MA V ZHURNAL EKSPERIMENTAL'NOY I TEORETICHESKOY FIZIKI in Russian Vol 39, No 6, 25 Mar 84 (manuscript received 20 Jan 84) pp 249-252

ZHARIKOV, Yu. A., OSIP'YAN, Yu. A. and SHEVCHENKO, S. A., Institute of Solid State Physics, USSR Academy of Sciences

[Abstract] Recent research on systems of different dimensions has led to quantum coherent theories of weak electron localization and electron-electron interaction to explain anomalous magnetic resistivity in semiconductors and

metals. Application of these theories is studied through experimental research on strongly plastically (25-40%) deformed Ge and resistivity is measured for various magnetic field intensities (0-20 kOe) and temperatures of 0.6-10 K. The appearance of anomalous magnetic resistivity for weak field currents (10^1 - 10^4 Oe) and the demonstrated temperature relations agree qualitatively with other semiconductor experimental results. The authors suppose that in the deformed Ge processes the dislocation structure has different dimensionalities and that quantum coherent events (weak electron localization or electron-electron interaction depending upon scale) affect conductivity in the magnetic field. LUMINOUS POINTS AND BREAKDOWN IN STRUCTURE OF GaAs TRANSISTORS

Leningrad FIZIKA I TEKHNIKA POLUPROVODNIKOV in Russian Vol 17, No 11, Nov 83 (manuscript received 25 Mar 83), pp 1931-1934

GASAN-ZADE, S. G., SAL'KOV, Ye. A. and SHEPEL'SKIY, G. A.

[Abstract] Physical effects preceding breakdown and failure of GaAs field-effect transistors are studied. Irreversible structural changes are experimentally shown to be linked to the appearance of radiation at the drain layered according to differential conductivity and forming luminous points which increase in size as the potential rises. Liquid Ga then forms and conductive channels near the brightest points at the drain lead to irreversible breakdown followed by burn-out. It is found that there are different mechanisms for point formation and Schottky barrier failure and for the drain domain failure. This is supported by the spectra since radiation from drain points is shifted to the shortwave range because of the higher space charge region field on the Schottky barrier in comparison with the drain domain field. Figures 2, references 5: 4 Russian, 1 Western.

COMPOSITION OF METAL FILMS ON GALLIUM ARSENIDE SURFACE

Moscow DOKLADY AKADEMII NAUK SSSR in Russian Vol 273, No 6, Dec 83 (manuscript received 30 Jun 83), pp 1345-1348

ALESHIN, V. G., NEMOSHKALENKO, V. V., SEMASHKO, Ye. M. and SENKEVICH, A. I., Institute of Metal Physics, UkSSR Academy of Sciences, Kiev

[Abstract] The technically important electrical characteristics of the metal-GaAs contact are determined by the characteristics of the materials, metal deposition conditions and boundary interaction that form the transitional zone.

The composition of the metal films at the boundary and the effect of high temperature heat treatment are studied by X-ray electron spectral analysis. It is established that during metal deposition the GaAs boundary decomposes and arsenic and gallium enter the metal film. At high temperatures, complex multilayer and multicomponent processes occur in the GaAs-metal system that depend on the thermodynamics of the total boundary layer system. The electrical characteristics of the metal-GaAs contact deteriorate because of metal ions in the semiconductor, changes in GaAs layer stoichiometry due to metal interaction and defect formation inducing states in the GaAs forbidden band and increasing barrier tunneling. Figures 3, references 11: 5 Russian, 5 Western.

EFFECT OF NEGATIVE DIFFERENTIAL CONDUCTIVITY IN QUASI-TWO-DIMENSIONAL SEMI-CONDUCTOR SUPERLATTICES

Moscow DOKLADY AKADEMII NAUK SSSR in Russian Vol 273, No 6, Dec 83
(manuscript received 17 May 83) pp 1351-1355

IGNATOV, A. A., Institute of Applied Physics, USSR Academy of Sciences, Gorkiy

[Abstract] The characteristics of superlattice (GaAlAs) semiconductor miniband carrier mobility that produces the negative differential conductivity effect leading to microwave generation have been studied by numerical Monte Carlo methods. This work is continued in the paper that analytically studies superlattice fluctuations and high-frequency characteristics. A correlation function is obtained for carrier fluctuations. Carrier diffusion coefficients are computed, enabling determination of characteristic wave build-up scales and increments, and establishment of characteristic stimulated emission frequencies. Quasi-two-dimensional GaAlAs superlattices are shown to have negative differential conductivity in a broad frequency range covering the submillimeter band and the planar structure assures significant emission power. They are of great interest as solid-state sources for extremely high frequencies. Figure 1.

TUNNEL CENTERS WITH NEGATIVE U AND PHOTOSTIMULATED REACTIONS IN SEMICONDUCTORS

Moscow PIS'MA V ZHURNAL ESKPERIMENTAL'NOY I TEORETICHESKOY FIZIKI in Russian Vol 39, No 5, 10 Mar 84 (manuscript received 9 Jan 84) pp 211-213

BAGRAYEV, N. T. and MASHKOV, V. A., Physical-Technical Institute imeni A. F. Ioffe, USSR Academy of Sciences

[Abstract] The occurrence of negative U is examined for the case characterized by the absence of the Jahn-Teller effect and significant deformations of the deep center wave functions as the charge state varies. The transition of a

center to a new equilibrium position as its charge state changes is the equivalent of Jahn-Teller distortion in the proposed model. A tunnel system with two-electron, single-electron and empty charge states is examined. The tunnel systems of centers that are detected are found to have negative U due to the fact that the electron-vibrational interaction constant depends on the charge state. Figures 2, references 10: 3 Russian, 7 Western.

GAMAN, V. N., Siberian Physical-Technical Institute V. D. Kuznetsov, Tomsk State University

[Abstract] The possible nature of the electron processes responsible for charge transfer during direct and reverse shifts in diode structures based on gallium arsenide compensated with impurities containing deep centers is discussed. The behavior of the forward and reverse branches of the current-voltage characteristics is described. GaAs (Mn) diode structures, the tunnel-recombination current component, dual injection current in p- π -n structures and GaAs (Fe) diode structures are characterized. The influence of these levels on the temperature behavior of switching parameters is analyzed, and switching time is studied as a function of diode voltage. Figures 10, references 40: 29 Russian, 11 Western.

KHLUDKOV, S. S., Siberian Physical-Technical Institute imeni V. D. Kuznetsov, Tomsk State University

[Abstract] Promising areas for the use of high resistance crystals and layers of gallium arsenide doped with impurities with deep centers as active components in electronic devices are demonstrated. The basic methods for obtaining high resistance layers are characterized, and some of the characteristics of diffusion doping of gallium arsenide with transition element impurities are described. Using the processes that occur in the strong electric fields present

in the reverse branch of the current-voltage characteristic makes it possible to obtain higher speed (by 3 or 4 orders of magnitude) in S-diodes than in existing injection S-diodes. Figures 8, references 67: 57 Russian, 10 Western. [265-6900]

IMPURITY TRAPPING DURING GAS PHASE EPITAXY OF GALLIUM ARSENIDE

Tomsk IZVESTIYA VYSSHIKH UCHEBNYKH ZAVEDENIY: FIZIKA in Russian Vol 26, No 10, Oct 83 pp 31-44

LAVRENT'YEVA, L. G.

[Abstract] The possibility of using models of equilibrium impurity distribution between phases and nonequilibrium trapping limited by surface kinetics for describing doping principles during gallium arsenide epitaxy in chalcogenide-hydrogen systems is discussed. The equilibrium approximation is found to describe satisfactorily the nature of variation in the concentration of an atomic impurity in the gas phase near the growth surface; however, it does not reflect adequately the principles underlying the transition of the impurities from the gaseous to the solid phase. As a first approximation, the Barton-Cabreri-Frank model describes satisfactorily the kinetics of impurity trapping during gas phase epitaxy of gallium arsenide; however, the application of this model to crystallization in gas phase epitaxy systems was restricted because of the complexity of the systems and the need for taking into account the behavior of chemical reactions in relatively dense adsorption layers. Figures 8, references 46: 27 Russian, 19 Western.

 Institute of Rare Earth Metals Industry, Moscow

[Abstract] The influence of the growing temperature and atomic ratio As/Ga in the gaseous phase on the electrophysical properties of epitaxial layers of GaAs forming an active region in a solar cell structure, and accordingly on its photoelectric parameters, is studied. The spectral distribution of the collection coefficient of the solar cell and the light load response of a typical solar cell are analyzed. The experimental efficiencies of approximately 17% indicate that the organometal gas-phase epitaxy method is promising for the mass production of high efficiency solar cells. Figures 4, references 5: 1 Russian, 4 Western.

EFFECT OF LIGHT PULSES ON FILM OF CHALCOGENIDE VITREOUS SEMICONDUCTORS

Leningrad ZHURNAL TEKHNIЧЕСКОY FIZIKI in Russian Vol 54, No 1, Jan 84
 (manuscript received 17 Mar 83) pp 186-187

KOLOBOV, A. V. and SEBAST'YAN, N., Physical-Technical Institute imeni A. F. Ioffe, USSR Academy of Sciences, Leningrad

[Abstract] Findings are presented from experiments on exposing AsSe films, in which photostructural transformations are expressed most clearly, to short light pulses ($\lambda=520$ nm, $\tau=200$ ns). The change in transmission is found to be independent of the light intensity for intensity smaller than approximately 10^5 W/cm², indicating that the light intensity and the number of pulses are interchangeable. The transmission is observed to change more for higher light intensities, showing increased light sensitivity. The hypothesis of a thermal mechanism underlying variation in the transmission of chalcogenide vitreous semiconductor films subjected to powerful light pulses is verified experimentally. A light intensity region is shown to exist within which the light sensitivity increases by up to two orders of magnitude. Figures 2, references 6: 4 Russian, 2 Western.

SPECTRAL BEHAVIOR OF DELAY OF RADIATION OF (GaAl)As DIODES

Leningrad ZHURNAL TEKHNIЧЕСКОY FIZIKI in Russian Vol 54, No 1, Jan 84
(manuscript received 13 Feb 83) pp 173-175

POPOV, Yu. V. and TRAPEZNIKOV, M. B.

[Abstract] The radiation spectrum of structures based on unilateral and bilateral heterojunctions is used to measure radiation delay. The delay behavior, according to the spectrum of the modulated radiation, differs for devices fabricated in different ways due to re-radiation of the stream of generated photons and the coexistence of several electroluminescence channels. The behavior of $\tau_d(\lambda)$ is found to depend upon the mechanism underlying the formation of the spectral relationship between the delay and autoabsorption for "zonality" of the active region. The depth at which reradiation effects occur is determined in part by the size of the radiation recombination quantum yield. Figures 2, references 7: 6 Russian, 1 Western.

FIELD RELAXATION IN WAVEGUIDE METAL-DIELECTRIC-SEMICONDUCTOR ELECTROABSORPTION OPTIMAL MODULATOR

Leningrad ZHURNAL TEKHNIЧЕСКОY FIZIKI in Russian Vol 54, No 1, Jan 84
(manuscript received 11 Jan 83) pp 110-114

MAKSIMOV, A. V., BLAGODAROV, A. N. and NAGOVITSYN, N. A., Leningrad Polytechnical Institute imeni M. I. Kalinin

[Abstract] A study is presented of electrical field relaxation in an MDS waveguide caused by the generation of electron-hole pairs, which is one of the factors underlying the dependence of the modulator parameters on the intensity of the modulating light. The MDS modulator is described, and equations are derived to describe the electrical field of relaxation. If the holes are captured by traps at the interface, the field does not relax regularly along the modulator; if the holes are distributed uniformly under the electrode, the relaxation is simultaneous. Formulas are derived that describe the operation of the modulator. Figures 5, references 2 Russian.

Polytechnical Institute imeni A. Ya. Pel'she, Physical-Power Institute of
Latvian SSR Academy of Sciences

[Abstract] The spectral distribution of GaAs p-n junctions during breakdown from small p-n junctions is studied to obtain a spectrum with less distortion. The radiation spectrum during avalanche breakdown of p-n (or n-p) GaAs junctions is wide (extending to photon energies of 3.5 eV) and smooth, with a slight maximum at energy corresponding to the width of the forbidden band of GaAs. The occurrence of a peak in the spectrum of radiation with photon energy close to that of the forbidden band of GaAs may be due to photoluminescence of the area surrounding the breakdown region. imeni M. V. Lomonosov

[Abstract] A method is described for investigating the photoelectric and luminescent properties of lead chalcogenide films in scanning electron microscopes. Local heterogeneities in the induced conductance and luminescence of polycrystalline PbS films are investigated and compared with oxygen localization regions on the surface. Methods of β -induced conductivity and cathode luminescence for investigating lead chalcogenide films are presented. The local connection between luminescent and dielectric properties is established from images of the same section of film. Electron irradiation of the films with the microscope operating in different modes resulted in changes in the properties. Coinciding areas of photosensitivity and strong cathode luminescence are shown to result from irregular oxidation of the films and to decrease in oxygen is desorbed. MARKOV, A. V., GRISHINA, S. P., MIL'VIDSKIY, M. G. and SHIFRIN, S. S., State Scientific Research and Design Institute of Rare Earth Metals Industry, Moscow

[Abstract] Single crystals of semiinsulating gallium arsenide grown on a layer of B_2O_3 (20-60 mm in diameter) with horizontally directed crystallization are investigated. It is found that annealing at temperatures below 900°C results in the formation of point defect complexes, but that complex formation is blocked in large regions about high temperature growth dislocations. Projection etching was used to establish that the annealing time for a given annealing temperature is significantly shorter for the bottom of the ingot than for the top. The complex formation rate is also higher in crystals that are grown rapidly. The connection between complex formation and variation in the electrophysical properties of the material is established; the influence of dislocations and the stability of the properties of heat treated crystals is investigated. Figures 5, references 10: 7 Russian, 3 Western.

GROWTH RATE OF MICRODESTRUCTION SITES IN ALKALI HALIDE CRYSTALS CAUSED BY
CO₂ LASER PULSES

Leningrad ZHURNAL TEKHNIЧЕСКОY FIZIKI in Russian Vol 54, No 2, Feb 84
(manuscript received 11 Jan 83) pp 323-326

KRUTYAKOVA, V. P. and SMIRNOV, V. N., Institute of Thermal Physics, Siberian
Department, USSR Academy of Sciences

[Abstract] The growth rate of the sizes of sites of microdestruction is measured and investigated as a function of the time at which the laser pulse is initiated. It is found that the interaction of pulses from a CO₂ laser with radiation power density exceeding a critical value is accompanied by the formation of microscopic damage within alkali halide crystals whose dimensions and concentrations within the caustic of the focusing lens increase as the power density increases. The findings agree qualitatively with the results of an investigation of the growth kinetics of scattering associated with the formation of microdestruction. Academy of Sciences, Moscow

[Abstract] The permittivity of a pressed dielectric-metal mixture near the critical transition point is investigated. A mathematical model is developed for the behavior of the mixture, and the conductivity and permittivity are investigated as a function of frequency and of the content of mixture components. Technology is developed for fabricating metal-dielectric mixtures, and permittivities are measured. Figures 3, references 8: 2 Russian, 6 Western. [270-6900]

THIN-FILM $(\text{Al,Ga})\text{As}$ HETEROJUNCTION SOLAR CELLS

and CHEBAN, L. I., Kishinev Polytechnical Institute imeni S. Lezo

[Abstract] Properties of $\text{pAl}_x\text{Ga}_{1-x}\text{As-nGaAs}$ thin-film solar cells removed from GaAs substrates are investigated; the possibility of employing such cells as cascaded solar cells employing an Si cell as a narrow-band element is examined. Load characteristics and spectral photosensitivity distribution are examined for different types of cells. The development of high efficiency solar cells based on solid solutions of $\text{Al}_x\text{Ga}_{1-x}\text{As}$ ($x \approx 0.27$) makes it possible to obtain overall efficiency exceeding 30% in an AlGaAs/Si cascaded solar cell. (manuscript received 1 Dec 83) pp 1091-1094

GURIN, V. N., KORSUKOVA, M. M., KALASHNIKOV, Ye. V. and NIKANOROV, S. P.,
Physical-Technical Institute imeni A. Ioffe, USSR Academy of Sciences

[Abstract] The authors analyze conditions under which single crystals of refractory compounds with stoichiometric composition are synthesized. It is found to be impossible to obtain stoichiometric single crystals from the actual melt for most refractory compounds. Such single crystals can be obtained in most cases from solutions in melts of low-melting metals (such as aluminum, zinc, magnesium). Conditions are specified under which single crystals of stoichiometric composition can be synthesized. It is found that obtaining single crystals of refractory compounds of stoichiometric composition from the actual melt requires data on the position of the stoichiometry line; obtaining crystals by the solution method requires information regarding the

intersection of the line with one of the branches of the region of homogeneity at low temperatures, and about the presence of solid solutions between the solvent and crystallized compounds. Figures 4, references 5: 3 Russian, 2 Western.

[Abstract] The influence of irradiating ZnSe, CdS, ZnTe, CdSe and CdTe crystals with LGI-21 and M-2000 nitrogen lasers on the intensity and photoluminescence spectra at 300, 77, and 4.2 K is investigated as a function of the power density and pulse repetition frequency. Structural defects are found to occur in the surface layer of A_2B_6 crystals that create radiative and nonradiative recombination centers changing the quantum yield and producing new bands in the photoluminescence spectra. The most probable mechanisms underlying the occurrence of defects is photo-amplified and recombination-amplified processes, as well as movement and propagation of dislocations. Figures 5, references 27: 19 Russian, 8 Western.

LOW-THRESHOLD INJECTION LASERS ON GROWN GaInPAs/InP HETEROSTRUCTURES (1.2-1.6 μm WAVELENGTHS)

Leningrad ZHURNAL TEKHNIЧЕСКОY FIZIKI in Russian Vol 54, No 3, Mar 84
(manuscript received 31 Mar 83) pp 551-557

AVDEYEVA, V. P., BEZOTOSNYY, V. V., VASIL'YEV, M. G., DOLGINOV, L. M., DRAKIN, A. Ye., DURAYEV, V. P., YELISEYEV, P. G., MAL'KOVA, N. V., MIL'VIDSKIY, M. G., SVERDLOV, B. N., SKRIPKIN, V. A. and SHEVCHENKO, Ye. G., Institute of Physics imeni P. N. Levedev, USSR Academy of Sciences, Moscow

[Abstract] Injection lasers operating at 1.2-1.6 μm wavelengths are most desirable for optical communication systems operating at 1-2 GHz carrier frequencies, corresponding to maximum attainable rates and ranges of data transmission over optical fibers. Such injection lasers have been developed on GaInPAs/InP isoperiodic heterostructures. A grown buried-stripe configuration with the active layer in the form of a dielectric strip waveguide embedded in a material with lower refractive index has been found to be most nearly ideal.

Using a p-InP substrate offers optimum technological advantages, namely a most easily reproducible positioning of the p-n junction relative to the heteroboundaries, absence of a depletion region at the heterostructure surface with no leakage of Zn atoms from acceptor-doped upper layers, and adequacy of a linear low-resistivity contact layer adjoining the p-InP substrate instead of an otherwise required quaternary-compound contact layer. Such heterostructure were produced experimentally by 2-stage liquid-phase epitaxial growth, the p-InP substrates oriented in the (100) plane and doped with Zn to a concentration of 10^{18} - $2 \cdot 10^{18}$ cm^{-3} . The dislocation density did not exceed $3 \cdot 10^{-4}$ cm^{-2} . The dislocation density did not exceed $3 \cdot 10^4$ cm^{-2} and in better specimens remained below 10^3 cm^{-2} . In the first stage of the process, a 3-4 μm p-type emitter layer, a 0.1-0.3 μm pure active layer, and a 3 μm n-type emitter layer were grown. The emitter material was InP for shorter-wave lasers and GaInPAs for longer-wave lasers, with dielectric symmetry provided in each case. The second stage of the process involved photolithographic masking with 4-12 μm wide SiO_2 strips in the [110] direction and subsequent chemical etching of buried stripes down to the p-region so as to produce a stripe with upward widening "dovetail" cross section. The growth material here was InP for 1.3 μm lasers with 1.04-1.06 μm edge and GaInPAs for 1.5-1.6 μm lasers as well as for some 1.3 μm lasers. The p-n counterjunction for electrical isolation outside the active region was produced either by growing an n-type material and doping it with Zn by diffusion to the depth of the active layer, sometimes with the aid of an oxide film, or by growing alternately n-type and p-type layers with compensatory doping to reduce the concentration to $2 \cdot 10^{16}$ cm^{-3} . The performance of all these laser diodes was evaluated in terms of super-luminescence and evolution of their amplification spectra, emission spectra in the continuous-wave mode, power-current characteristic in continuous-wave mode and in pulse mode, dependence (linear) of threshold current on width of the active strip ranging from 1-2 kA/cm^2 at 1.3 μm wavelength to 2.5 kA/cm^2 at 1.5-1.6 μm wavelengths, temperature dependence (linear) of the threshold current, and degradation of performance with rising ambient temperature. Injection lasers of this kind with mode selection and transverse stabilization tend to emit radiation at a single frequency, with one longitudinal mode carrying 90% or more of the total emission power, which is very useful for high-resolution spectrometry. SYMMETRY OF EXCHANGE INTERACTION IN CRYSTALLINE MAGNETIC FILMS

Moscow DOKLADY AKADEMII NAUK SSSR in Russian Vol 275, No 1, Mar 84
(manuscript received 20 Apr 83) pp 71-74

KOZHUKHAR', A. Yu.

[Abstract] Exchange interaction and its symmetry in epitaxial crystalline ferrite-garnet films were examined by the spin-wave-resonance method over a wide range of temperatures. Overlapping of wave functions of magnetically active

ions provides the mechanisms of such an interaction generally, and in this particular case electrical symmetry of octahedral and tetrahedral sublattices determines the symmetry. Films of $\text{Y}_3(\text{FeGa})_{50}\text{I}_2$, 2.63–5.86 μm thick with axial symmetry, were grown epitaxially on gadolinium-gallium garnet with (111) orientation as substrate. Disks 1 mm in diameter were cut with polished lateral surface and etched back surface, their ferromagnetic resonance lines were $2\Delta H = 0.50\text{--}0.80$ Oe wide, their saturation magnetization was $4\pi M = 1490$ GS, and the mismatch of their lattice constants was $\Delta a = +9 \cdot 10^{-3}$ Å. Spectra of spin-wave resonance were recorded with a high-resolution radiospectrometer in magnetic fields parallel or perpendicular to the normal to the film surface, at a typical frequency of 9.22 GHz at room temperatures, and the temperature dependence of splitting was measured at the same frequency over the 200–500 K temperature range. The data were used to calculate the exchange interaction energy. The results indicate that the exchange energy anisotropy is caused not by demagnetization but by elastic deformation of the film. This interpretation agrees with the model of anomalously differing exchange interaction constants based on domain structure and Curie temperature measurements. The author thanks N. I. Zotov for assisting in the study, B. P. Nam for supplying the specimens, and L. M. Letyuk for useful discussion of the results. Article was presented by Academician B. N. Laskorin on 20 April 1983. PHOTOELECTRIC EFFECT IN LIQUID CRYSTALS

Moscow DOKLADY AKADEMII NAUK SSSR in Russian Vol 275, No 1, Mar 84
(manuscript received 26 May 83) pp 60–63

VISTIN', L. K., Institute of Crystallography imeni A. V. Shubnikov, USSR Academy of Sciences, Moscow; KAZLAUSKAS, P.-A. V. and PAYEDA, S., Vilnius State Pedagogical Institute

[Abstract] An experimental study was made of the photoelectric effect in nematic liquid crystals with intramolecular charge transfer and wide light absorption band, for the purpose of determining the effect of low-intensity illumination on the photoelectric properties of such crystals and particularly the photoconduction threshold in constant or low-frequency alternating electric fields. Measurements were made on ZhK-29 and ZhK-67 crystals consisting of a mixture of cyanobiphenyls and tolans. Specimens of 10 μm thick electrooptic cells with planar orientation and SnO_2 electrodes with 2 cm^2 surface area were assembled by a standard method. They were exposed locally to white light of a few mW/cm^2 power density. The cell resistance was measured with a Ye6-13 teraphmmeter. The resistance was found to depend on both intensity and spectral content of the light. The decrement of resistance under illumination was found to depend on the chemical composition of the crystal, being somewhat larger in ZhK-29 crystals than in ZhK-67. The test results reveal that the resistance decrement increases with better substrate surface finish and with higher degree of planar orientation. It varies with temperature, becoming maximum in an

isotropic melt. The resistance decrement in crystals pretreated in a weak constant electric field increases with increasing degree of polarization. The increase of photoconduction is attributed to dissociation of excited molecules and buildup of charge carrier concentration. The shape of a photo-emf voltage pulse is different in crystals of different compositions, its amplitude also depending on the constant bias voltage. Reverse bias causes first compensation and then reversal of photo-emf voltage polarity, the crystals having a long polarity "memory". Examination under an LYuMR-1 luminescence microscope has confirmed the local character of changes in the thresholds of electrooptic effects such as the Fredericks effect and EHD instability. The authors thank S. A. Pikin for helpful comments. Article was presented by Academician B. K. Vaynshteyn on 20 May 1983. Figures 3, references 12: 11 Russian, 1 Western. [245-2415]

VAYNSHTEYN, 30 May 83, State Scientific Research and Planning Institute of the Rare Metals Industry; All-Union Structural Engineering Correspondence Institute; Institute of Crystallography imeni A. V. Shubnikov, USSR Academy of Sciences, Moscow

[Abstract] The microcathodoluminescence spectra of YAG:Nd crystals, grown by directional horizontal crystallization in molybdenum containers, were studied using a JXA-3A electron probe microanalyzer equipped with a cathodoluminescence attachment. The spectral resolution of the optical system was improved through the use of an MM-101 monochromator with a set of diffraction gratings capable of a black dispersion 380 to 410 nm band of about 29 Å/mm. The sensitivity of the luminescence phase analysis of crystal inclusions was enhanced by applying conductive transparent layers of a composition of indium and tin oxides to the samples; this enabled the registration of no less than 85% of the exiting microcathodoluminescence emissions. This technique of exciting just an individual microinclusion in the sample and observing the emission from this region and scanning the exciting beam successfully reveals phase inhomogeneities in complex oxide single crystals, and determines both the structure of the inhomogeneities and their distribution over the sample volume. The data from the YAG:Nd studies demonstrate that it is possible to unambiguously identify the structure of microscopic inclusions even under unfavorable conditions, when the luminescence probe signal in the impurity phase is greatly attenuated as compared to the probe emission in the main material. It can be anticipated that similar studies of garnet phase inclusions in yttrium-aluminum-perovskite will be a much easier task, since at the usual activator concentration in this material of 1 to 2% there should be no suppression of the luminescence of garnet inclusions. Luminescence phase analysis techniques can play a significant part in the development of crystallization process theory for multicomponent systems as well as the refinement of production processes for growing large perfect crystals. EXCITATION OF QUASI-STATIC MAGNETIC FIELDS WITH AXIAL STRUCTURE

Moscow DOKLADY AKADEMII NAUK SSSR in Russian Vol 272, No 2, Sep 83
(manuscript received 3 Jan 83) pp 344-346

KARPENKO, A. G., LOBACHEVSKIY, L. A. and MIGULIN, V. V., Institute of Terrestrial Magnetism, the Ionosphere and Radio Wave Propagation, USSR Academy of Sciences, Moscow

[Abstract] Quasi-static magnetic fields generated in the air above the sea surface by AC with an insulated immersed branch and the water serving as a return are not dipolar as in a closed loop but have an axial structure. It is established that the magnetic field intensity in air is determined practically by the length of the submerged conductor alone. Experimental measurements were made for a field excited over the sea and coast by a current of 78 Hz and 25 A in a 200 m insulated conductor immersed to a depth of 1 m. A sharp and unexplained drop was observed at the land-sea boundary, the field intensity being relatively higher than the computed value before the discontinuity and relatively lower afterwards. The important feature is a law for intensity decrease with distance from the conductor which is D^{-3} for a closed loop and D^{-2} for the axial structure field and this could have practical importance since the effectiveness of axial field excitation with low and very low frequencies is significantly higher than that of dipolar fields. Figure 1.

TRANSFORMATION OF HETEROGENEOUS SURFACE WAVES BY SKEWED STREAMS

Kiev DOKLADY AKADEMII NAUK UKRAINSKOY SSR: SERIYA A, FIZIKO-MATEMATICHESKIYE I TEKHNIЧЕСKIYE NAUKI in Russian No 3, Mar 84 (manuscript received 24 Jan 83) pp 48-52

YEVDOKIMOV, A. P., Institute of Radiophysics and Electronics, Ukrainian SSR Academy of Sciences, Kharkov

[Abstract] Scattered electromagnetic fields arising as the result of interaction between the surface waves of a planar dielectric waveguide with a periodic structure consisting of a skewed reflecting lattice are investigated.

The radiating portion of the spectrum of the scattered field is shown to propagate from the plane containing the direction of propagation of the heterogeneous planar dielectric waveguide wave. There is found to be a critical angle at which the scattered field represents a heterogeneous electromagnetic wave propagating along the surface of the periodic structure. It is demonstrated possible to control the propagation direction for volume and surface diffraction waves in the structure in question. Figures 2, references 3 Russian.

GAS DYNAMICS OF COMBUSTION OF GAS-AIR MIXTURE IN SEMI-CLOSED SPACE WITH RELIEF OF PRESSURE INTO GASLESS ADJACENT SPACE

Novosibirsk FIZIKA GORENIYA I VZRYVA in Russian Vol 20, No 1, Jan-Feb 84
(manuscript received 1 Mar 83; revised 14 Apr 83) pp 65-69

STREL'CHUK, P. A., MISHYYEV, A. V., NIKITIN, A. G. and ORAKHELASHVILI, N. V.

[Abstract] Experiments are conducted to provide a physical description of the processes occurring during the release of pressure from a gas-filled chamber into a gasless chamber when the holes connecting the first chamber to the atmosphere are small in order to ensure safe pressures when the mixture contained ignites. The gas dynamics of the combustion occurring in the two-chamber system is studied, and the basic factors influencing the process are identified. The model employed was a 100-liter cubic chamber divided in half by a barrier and communicating with the atmosphere through a hole. The gas employed was propane. The influence of the additional chamber on the way in which the pressure in the first chamber behaves is studied experimentally. It is found that the presence of an adjacent gasless compartment leads to sharp intensification of combustion in the two-chamber system, which is accompanied by alternating overflow of gases between the chambers, and that the combustion of the gas-air mixture in both chambers becomes highly turbulent. ASSESSMENT OF INFLUENCE OF THREE-DIMENSIONAL EFFECTS ON DEVELOPMENT OF
TRANSIENT CONCENTRATION NATURAL CONVECTION IN CLOSED REGION

Moscow IZVESTIYA AKADEMII NAUK SSSR: MEKHANIKA ZHIDKOSTI I GAZA in Russian
No 5, Sep-Oct 83 (manuscript received 12 Apr 82) pp 175-178

KOROLEVA, I. N., NIKULIN, D. A. and STRELETS, M. Kh.

[Abstract] The problem of transient concentration natural convection of a binary mixture of gases with an arbitrary finite ratio of densities in a closed rectangular heat insulating region is investigated with consideration of three-dimensional effects associated with the finiteness of the dimensions of the region. The flow is described by a system of equations representing the limiting form of a full system of Navier-Stokes equations. The analysis shows that the stronger the convection, the greater the error resulting from the assumption of a two-dimensional flow. Figures 3, references 5: 2 Russian, 3 Western. [258-6900]

INFLUENCE OF DISTRIBUTED INJECTION OF POLYMER SOLUTION ON CHARACTERISTICS OF
TURBULENT BOUNDARY LAYER

Moscow IZVESTIYA AKADEMII NAUK SSSR: MEKHANIKA ZHIDKOSTI I GAZA in Russian
No 5, Sep-Oct 83 (manuscript received 2 Jun 82) pp 58-64

ALEKSIN, V. A., MIKHAYLU, A. G. and PILIPENKO, V. N.

[Abstract] The movement of a plate during distributed injection of a polymer solution is examined on the basis of a system of partial differential equations.

It is shown that drag can be significantly reduced by injecting the solution in a distributed fashion. For example, the reduction in drag is 94% for a solution with a concentration of $3 \cdot 10^{-5}$ and $F=2 \cdot 10^{-3}$. Calculations show that less polymer is needed to obtain the same reduction in drag when distributed injection is used. Figures 4, references 16: 9 Russian, 7 Western.

CHARACTERISTICS OF INTERACTION OF EXPLOSIVE WAVES FROM SPHERICAL DEFLAGRATION WITH OBSTACLE

Novosibirsk FIZIKA GORENIYA I VZRYVA in Russian Vol 20, No 1, Jan-Feb 84
(manuscript received 18 Aug 82) pp 121-123

BYSTROV, S. A. and GOREV, V. A.

[Abstract] The difference in the behavior of explosive waves on an obstacle due solely to the profile characteristics are found. The maximum pressure of the positive phase of the wave and the wave momentum are taken to be identical. It is found that the maximum pressure drop and momentum in the positive phase of the wave must be known in order to assess correctly the interaction between explosive waves from gas deflagration and obstacles. Depending upon the duration of the wave and the relaxation time of the obstacle, it may be necessary to determine the entire profile of the wave. The direction in which to expect destruction can be judged by comparing the duration of the wave with the period of the natural oscillations of the construction. Figures 3, references 3: 2 Russian, 1 Western.

INFLUENCE OF COMPOSITION OF COMBUSTIBLE GAS MIXTURE ON PARAMETERS OF PLANE SHOCK WAVE GENERATED DURING EXPLOSION IN AIR

Novosibirsk FIZIKA GORENIYA I VZRYVA in Russian Vol 20, No 1, Jan-Feb 84
(manuscript received 18 Feb 83) pp 90-93

VOYTOV, A. P., GEL'FAND, B. Ye., GUBIN, S. A., MIKHALKIN, V. N. and SHARGATOV, V. A.

[Abstract] The influence of the composition of a combustible mixture on the parameters of a plane shock wave in air generated by an explosion is investigated. The detonation wave is induced along the plane of symmetry; the shock wave begins to propagate after the detonation wave reaches the interface boundary in the air. The resulting nonstationary flow is described by unidimensional gasdynamic equations in lagrangian coordinates. The pressure at the front of a shock wave in air is computed as a function of the distance traveled by the shock wave. The nature of redistribution between internal and kinetic energy in air is discussed. Figures 3, references 7: 6 Russian, 1 Western.

SHOCK WAVE PROPAGATION IN AIR SUSPENSION OF SOLID PARTICLES

Novosibirsk FIZIKA GORENIYA I VZRYVA in Russian Vol 20, No 1, Jan-Feb 84
(manuscript received 22 Feb 83) pp 86-90

GAVRILENKO, T. P. and GRIGOR'YEV, V. V.

[Abstract] Mechanical oscillations are employed to obtain a uniform concentration of solid particles in air suspension. Experiments to investigate shock wave propagation in the suspension produced are described. It is found that mechanical oscillations make it possible to obtain a uniform air suspension with the required concentration in channels approximately one meter long. The approximate model employed describes the attenuation of a nonstationary shock wave accurately enough for practice. The discrepancy in the analytical data does not exceed 20% up to Mach numbers of $m=2$. Figures 3, references 7: 5 Russian, 2 Western.

TRANSITION FROM EXPLOSION TO DETONATION IN POROUS EXPLOSIVES

Novosibirsk FIZIKA GORENIYA I VZRYVA in Russian Vol 20, No 1, Jan-Feb 84
(manuscript received 11 Oct 82; revised 30 Nov 82) pp 70-77

AKHATOV, I. Sh. and VAYNSHTEYN, P. B.

[Abstract] Possible mechanisms underlying the smooth and explosive transition modes in a porous model explosive, or high-calorie powder, are investigated. It is found that if the work performed by the forces of the intergranular

pressure goes entirely to heating of the gas, there is a smooth transition from combustion to detonation of porous explosives. If some of the work is transformed to internal particle energy (elastic or thermal), explosive transition occurs. The explosive transition from combustion to detonation is discussed. Figures 6, references 14: 10 Russian, 4 Western.

EXPERIMENTAL INVESTIGATIONS OF DEVELOPING FLOW IN SQUARE CHANNEL ROTATING ABOUT TRANSVERSE AXIS

Minsk INZHENERNO-FIZICHESKIY ZHURNAL in Russian Vol 45, No 4, Oct 84
(manuscript received 5 Nov 82, synopsis received 18 Apr 83) pp 662-663

[Synopsis of article by A. V. Kuz'minskiy, Ye. M. Smirnov and S. V. Yurkin, deposited in the All-Union Institute of Scientific and Technical Information, 23 May 83, registration No 2765-83 Dep.]

[Abstract] Hydrogen bubbles are employed to study the velocity field in a laminar flow of water through a rotating channel under widely differing input conditions. Investigation of the time lines indicates that the fundamental effect of the Coriolis force shows up strongly for the modes investigated, with the nucleus of the stream having uniform velocity distribution along the lines parallel to the axis of rotation. Rotation is found to shorten the length of the initial flow section in the channel. References 12.

PROBLEM OF REDUCTION TO IDEAL WIND TUNNEL IN EXPERIMENTAL AERODYNAMICS

Moscow DOKLADY AKADEMII NAUK SSSR in Russian Vol 274, No 6, Feb 84
(manuscript received 22 Sep 83) pp 1309-1312

YANENKO, N. N., academician [deceased], VOSKOBOYNIKOV, Yu. Ye. and PREOBRAZHENSKIY, N. G., Institute of Theoretical and Applied Mechanics, Siberian Department, USSR Academy of Sciences, Novosibirsk

[Abstract] Reduction to an ideal wind tunnel is necessary in experimental aerodynamics for elimination of the instrument error which, in the case of a wind tunnel, results from distorting stochastic perturbations caused by the flow of air. In accordance with the entirely plausible linear model, the process actually measured and recorded is the sum of the principal streamlining process, an interference process not associated with streamlining and occurring beyond the zone of stream perturbation by the immersed body, and a noise process in the measuring and recording instruments. Assuming that the principal process and the sum of the two others are mutually independent, a Volterra integral equation of the first kind is derived for their probability distribution densities in a way that makes it possible to separate and exclude the instrument function characterizing the wind tunnel. The experiment thus becomes reduced to one in an "ideal" wind tunnel without interference. The corresponding problem for this equation is mathematically ill-conditioned and must be regularized before it can be solved, preferably by numerical experiment. Finiteness of interference and noise probability distribution densities, differenceness of its kernel, and inaccuracy of both its kernel and right-hand side have been taken into account in the algorithm of its solution. The procedure is demonstrated on evaluation of the emplitude distribution density of fluctuations in a turbulent stream flowing through a wind tunnel. Figures 2, references 7: 5 Russian, 2 Western.

EXPERIMENTAL STUDY OF MACH REFLECTION OF WEAK SHOCK WAVES

Leningrad ZHURNAL TEKHNIЧЕСКОY FIZIKI in Russian Vol 54, No 3, Mar 84
(manuscript received 3 Mar 83) pp 625-628

MAKAREVICH, G. A., LISENKOVA, G. S., TIKHOMIROV, N. A. and KHODTSEV, A. V.

[Abstract] An experimental study was made of Mach reflection of weak shock waves, shock waves of near acoustic intensity, for the purpose of determining the dependence of pressure in the reflected wave along the wall on parameters of the incident wave: its Mach number and its angle with the wall. Measurements were made in a wind tunnel of square (250 x 250 mm) cross section and 2 m long, connected at one end to a cubical (0.5 x 0.5 x 0.5 m) test compartment and at the other end through a dielectric transition piece to a cylindrical electric-discharge chamber. A cruciform gas duct feeding into the discharge chamber facilitated distributing the generated plasma uniformly over the tunnel cross section. Pressure measurements were made with two sets of transducers, smaller ones with pickup membranes 4 mm in diameter and larger ones with pickup membranes 20 mm in diameter, all having intrinsic capacitance of approximately 500 pF and sensitivity of 0.3 W/atm with vibration immunity within 0.001 atm/g (acceleration). Calibration of instruments during measurements minimized errors due to gain instability while extending the linear range of their characteristics and reducing the effect of electromagnetic interference. The diffraction pattern was photographed by the straight-shadow method. The ratio of pressure pulse amplitude at the wavefront to pressure pulse amplitude behind the wave was found to peak at an incidence angle within 50-60° and then to drop to zero at a 90° incidence angle (normal incidence), remaining quite high over the 0-50° range of incidence angles. Statistical analysis of the results using Student's t-test yielded a semi-empirical algebraic relation between the pressure rise due to reflection, as function of the incidence angle and the Mach number. As the incidence angle exceeds its critical magnitude, reflection ceases to be regular and becomes nonregular with the pressure in the reflected wave along the wall decreasing monotonically until it becomes equal to the pressure in the incident wave, regardless of the latter's intensity, when the incidence angle is 90°. Theoretical and experimental data on nonregular reflection of weak shock waves agree closely for incidence angles near the critical only, their discrepancy widening as normal incidence is approached. The results of this study supplement results obtained elsewhere on Mach reflection of strong shock waves and on transient interaction of shock waves. Figures 2, references 9 Russian.

ELECTRICAL CONDUCTIVITY PROFILES IN GASES DURING DETONATION

Moscow DOKLADY AKADEMII NAUK SSSR in Russian Vol 275, No 1, Mar 84
(manuscript received 19 Apr 83) pp 74-79

PINAYEV, A. V. and SYCHEV, A. I., Institute of Hydrodynamics imeni M. A. Lavrent'yev, Siberian Department, USSR Academy of Sciences, Novosibirsk

[Abstract] The electrical conductivity behind a detonation front in explosive gas mixture was measured with a special probe in shock tubes consisting of two

stainless steel segments separated by 0.1 mm thick insulating Teflon spacer rings. Both tubes had a 17.5 mm inside radius, one was 2.7 m long and one was 4.5 m long, an electrically insulated stainless steel wire with a 1, 2, or 3 mm radius running along the axis and a copper wire with a 2 mm radius electrically connecting the two isolated halves. The time derivatives of current di/dt in this copper conductor during propagation of a detonation wave along the second half of a tube was measured with differentiating magnetic transducers, ferrite rings of M 300 NN-3 and M 600 NN-8 material wound with 10-350 turns of wire ($n = 10$ turns corresponding to a load resistance of 10 ohms and a time constant of $0.2 \mu s$). The tubes, after evacuation, were filled with $H_2 + xO_2$ ($x = 1/2, 1$) or $C_2H_2 + yO_2$ ($y = 1, 5/2, 5$) mixtures to pressures of 0.1-2.5 atm. The gases used for these mixtures contained 99.7% O_2 , 99.9% H_2 , 99% C_2H_2 . The mixtures were ignited by a high-voltage discharge, transition from combustion to detonation within the first half of a tube was accelerated by means of a turbulizer. The profiles of pressure, velocity, and flow rate were almost the same with and without electrode wire in the tube. The conductivity readings and oscillograms did not depend on the radius of the center (axial) electrode, no thermionic emission of electrons occurred at the metal surface of the tubes during measurements. The experimental data reveal a cellular wave structure at low pressure and an attendant oscillatory conductivity profile that remains flat for a long time before peaking in $H_2 + xO_2$ mixtures and that peaks narrowly immediately at the wavefront in $C_2H_2 + yO_2$ mixtures. The sharp peaking of the conductivity at the front of a detonation wave and the smooth increasing of the conductivity (and the electron concentration) behind the front of a shock wave are interpreted theoretically as characterizing an ideal cold plasma, this difference in behavior being attributed to the effect of exothermic chemical reactions on the ionization process according to the Chapman-Jouguet detonation model with thermal (equilibrium) ionization in hydrogen-oxygen mixtures or dissociative (nonequilibrium) recombination in acetylene-oxygen mixtures. Article was presented by Academician S. S. Kutateladze on 11 April 1983. Figures 3, references 13: 7 Russian, 6 Western. [245-2415]

NUMERICAL ANALYSIS OF PARAMETERS OF SELF-HEATING COPPER VAPOR LASERS

Moscow TEPILOFIZIKA VYSOKIKH TEMPERATUR in Russian Vol 21, No 5, Sep-Oct 83
(manuscript received 19 May 82) pp 976-981

GALKIN, A. F., KLIMOVSKIY, I. I., and SELEZNEVA, L. A., Institute of High
Temperatures, USSR Academy of Sciences

[Abstract] Numerical analysis is employed to find operating modes of self-heating copper vapor lasers with discharge tubes of different diameters, in which the coefficient of conversion of the discharge input energy to lasing energy and the average lasing power are near maximum. The optimum buffer gas pressure, discharge tube diameter, pulse recurrence rate and excitation pulse length are analyzed. The results of various studies on the optimum excitation pulse recurrence rate are compared, and the causes for reduced lasing power over time are identified. Figures 6, references 19: 16 Russian, 3 Western.

Siberian Physical-Technical Institute imeni V. D. Kuznetsov, Tomsk State
University, Belorussian Polytechnical Institute

[Abstract] Lasing at λ -248 nm is achieved in an excimer laser by increasing the stability of the excited molecules by using an outside gas and a compound in which the quantum yield changes little as the stored vibrational energy increases. Pentane was used in the first case, and perylene in the second. The fluorescence spectra of pure vapors of POPOP and perylene are presented. Different classes of organic compounds with which lasing at λ =248 nm is achieved are presented. The lasing with vapors of organic compounds existed

by high energy light quanta indicates the possibility of lasing with complex molecules in the short wave ultraviolet region of the spectrum, as well as the efficiency of transforming the powerful radiation from excimer lasers to the near ultraviolet and visible portion of the spectrum. Figures 2, references 10 Russian.

(manuscript received 29 Oct 82) pp 181-189

STEL'MAKH, M. F., DMITRIYEV, V. G., MIKHAYLOV, L. K., SEREGIN, S. L., SPITSYN, Ye. M. and CHEREDNICHENKO, O. B.

[Abstract] A review is given of research and development on dye lasers employing acousticoptical filters, as well as spectral and analytical equipment based on dye lasers: laser spectrophotometers and atomic fluorescent spectrometers.

The basic formulas describing the operating principles of dye lasers with acousticoptical filters are presented, along with typical spectral characteristic values and the possibilities of controlling wavelength, line width and radiated power. It is found that laser atomic fluorescent spectrometers can be employed for trace element analysis of agricultural sites, for environmental protection and for a number of scientific and engineering problems. Laser spectrophotometers give qualitatively new information about investigated objects in a number of applications. Figures 4, references 9: 5 Russian, 4 Western.

USSR Academy of Sciences Institute of Physics

[Abstract] The influence of translational and hyperfine relaxation on the energy characteristics of chemical oxygen-iodine lasers is investigated. In the model, a homogeneous stream of oxygen, atomic iodine, argon and extinguishing impurities moves in a uniform velocity in a flat Fabry-Perot resonator. It is found that relatively low quenching rates at pressures of 1-5 mm Hg can cause a two-fold drop in the laser power. The results obtained are for single-mode lasing realized in resonators with short optical length. The nonuniform broadening and finite relaxation times noted must be taken into account in the practical development of chemical oxygen lasers and in the numerical modeling of lasing kinetics. Figures 2, references 14: 6 Russian, 8 Western.

Physical Measurements

[Abstract] The stationary transfer characteristics and transients at hetero-structure laser amplifiers are calculated on the basis of an empirical model that satisfies spontaneous emission of heterolasers at room temperature. Direct measurements of the physical parameters are made when narrow-band optical signals from an external source are input. Maximum gain of 26 dB was observed, with output signal to background ratio of 7 dB with no spectral selection, and 24 dB using an output filter with passband of 0.1 nm. The experimentally measured parameters confirm the promise of laser amplifiers for the development of new types of fiber optic communications line. Figures 5, references 7 Russian.

[Abstract] The influence of coherent effects on amplified pulse shape is examined in detail for high pulse energy density, maximum possible gain-length product and high energy contrast of input signal employing equipment with approximately 0.15 ns temporal resolution. The experimental setup and measurement method are described. It is shown that the effects of coherent interaction of a light pulse with the ambient medium can influence the form of radiation in power amplifier stages where the leading edge of the pulse is approximately 0.1 ns long and the energy density is approximately 1 J/cm². The observed effect is interpreted as causing oscillographically observed oscillations in pulse intensity. Figures 4, references 10: 7 Russian, 3 Western.

DISTRIBUTION OF ELECTROMAGNETIC FIELD AND GAIN IN FLAT RESONATOR OF CO₂ GDL WITH LARGE FRESNEL NUMBERS

Moscow KVANTOVAYA ELEKTRONIKA in Russian Vol 11, No 2 (140), Feb 84
(manuscript received 18 Mar 83) pp 262-268

BUTKOVSKIY, A. V. and DYNNIKOVA, G. Ya.

[Abstract] The influence that variation in the characteristic lengths of the exchange and relaxation processes occurring in an inversely populated CO₂-N₂-H₂O medium has on the field distribution in the modes of a flat resonator at large Fresnel numbers is investigated. Characteristics of the limiting geometric distribution associated with the presence of a high speed active medium, which do not occur in solid state lasers, are examined. A four-temperature kinetic model is used. The intensity and gain distribution obtained are compared with the results of calculations using a model developed elsewhere. When the equivalent Fresnel number is high enough, modes with near geometric optical intensity distribution have a minimum in the same distribution along the stream. Figures 8, references 15: 13 Russian, 2 Western.

INVERSION ACCUMULATION IN ACTIVE MEDIUM OF IODINE LASERS IN PRESENCE OF
IRREGULAR MAGNETIC FIELDS

Moscow KVANTOVAYA ELEKTRONIKA in Russian Vol 11, No 2 (140), Feb 84
(manuscript received 17 Mar 83) pp 257-261

BOBROV, B. D., KISELEV, V. M. and GRENISHIN, A. S.

[Abstract] The stored specific energy density in an iodine laser in external magnetic fields is estimated with allowance for the hyperfine structure of levels and the characteristics of the Zeeman effect. The energy density stored in the active medium of the laser in an irregular longitudinal magnetic field can be as high as several joules per square centimeter of active body. The theoretical relationships are tested experimentally on a laser with an active body 1 m long and 20 cm in diameter. The relationships presented for the amplification cross section can be used in developing variable-transmission iodine shutters in which absorption is controlled by a transient irregular field formed in the cell by a system of external solenoids. Figures 3, references 9: 8 Russian, 1 Western.

SOLAR-PUMPED LASERS (A REVIEW)

Moscow KVANTOVAYA ELEKTRONIKA in Russian Vol 11, No 2 (140), Feb 84
(manuscript received 31 May 83) pp 233-257

GOLGER, A. L. and KLIMOVSKIY, I. I., Institute of High Temperatures, USSR Academy of Sciences

[Abstract] A comparative analysis of various gas and solid state solar pumped lasers is presented. The review includes photodissociation solar pumped lasers, solar pumped laser systems employing ideal black body coatings or devices to absorb solar radiation, and solar pumped solid state lasers. The maximum efficiency, optimum transverse dimensions of the active medium and required solar energy concentration for solar pumped lasers are tabulated. Most laser arrangements can provide, under optimal conditions, maximum efficiency at the 3-5% level; however, all solar pumped lasers that have been developed to date have efficiency significantly lower than 1%. Figures 8, references 52: 31 Russian, 21 Western.

[Abstract] An AlGaAs laser is modulated by modulating the pumping current of a traveling wave amplifier. The experimental setup employs a single-frequency laser with an external dispersion resonator as a master oscillator. The optical spectrum width did not exceed twice the frequency of the modulating signal. Spectrally matched modulation minimizes the dispersion spreading of the light pulse, and implements special multiplexing of optical communications channels practically up to the theoretical limit. Figures 2, references 5: 1 Russian, 4 Western.

OPTIMIZATION OF ULTRASHORT PULSE GENERATION MODE OF YAG LASER

Moscow IZVESTIYA AKADEMII NAUK SSSR: SERIYA FIZICHESKAYA in Russian Vol 48,
No 3, Mar 84 pp 583-586

DEMCHUK, M. I., MIKHAYLOV, V. P. and CHERNYAVSKIY, A. F., Scientific Research
Institute for Applied Physical Problems, Belorussian State University

[Abstract] The limiting capabilities of passive mode-locked YAG laser are estimated for existing saturated absorber components. Practical recommendations are given for synthesizing new absorber components that provide the required laser parameters. The criteria developed for selecting absorber components, taken together with the experimental findings, make it possible to optimize passive mode locking in a YAG laser, either in terms of achieving the required set of laser parameters, or in terms of achieving maximum laser capabilities with respect to any one of the parameters. A group of dyes is identified that provide maximum pulse energy and minimum pulse duration for YAG lasers. The experimental findings are in accord with the theory of passive mode locking of solid state lasers. References 11: 10 Russian, 1 Western.

PULSE-PERIODIC YAG:Nd^{3+} ACTIVE MODE-LOCKED LASER WITH INTRACAVITY FREQUENCY DOUBLING

Moscow IZVESTIYA AKADEMII NAUK SSSR: SERIYA FIZICHESKAYA in Russian Vol 48, No 3, Mar 84 pp 573-576

APANASEVICH, P. A., ZAPOROZHCHENKO, R. G., ZAPOROZHCHENKO, V. A. and KACHINSKIY, A. V., Institute of Physics, Belorussian Academy of Sciences

[Abstract] A YAG:Nd^{3+} active mode-locked laser with intracavity frequency doubling is investigated. The parameters of the laser are given, and the output energy and ultrashort pulse duration are investigated as a function of cavity length for pulse repetition frequencies ranging from 1.5 to 100 Hz. The output energy and single pulse duration are also investigated as a function of the pumping energy. Intracavity second-harmonic generation is studied in an analogous laser. The parameters of pulses at frequencies ω and 2ω are investigated as a function of the difference in the phase creep of the fundamental radiation and the harmonic. Comparison of the experimental findings indicates that a laser with intracavity second harmonic generation is a self-consistent system in which the harmonic pulses can be shortened significantly by selecting such parameters as the phase difference in the crystal, the distance between the crystal and the common mirror of the cavities, the crystal length and the Q of the cavity at the second harmonic. Figures 4, references 1 Russian.

GRIBKOVSKIY, V. P. and ZYUL'KOV, V. A., Institute of Physics, Belorussian SSR Academy of Sciences

[Abstract] The results of an investigation of second-harmonic generation and scattering in group $A_2 B_6$ semiconductors with many-photon excitation are presented. Two-photon absorption, as well as the variation of the index of refraction of the crystals in the transparency region under the influence of laser radiation, are described. A shadow method is employed that is applicable for investigating the mechanism underlying the nonlinearity of the index of refraction and for studying fast recombination processes in semiconductors. Figures 4, references 10: 6 Russian, 4 Western.

DIETEL, W., RUDOLPH, W., WILHELMI, B., Friedrich Schiller University, GDR; DIELS, J. C. and FONTAINE, J. J., North Texas State University

[Abstract] New experimental findings are presented concerning the generation of pulses in "colliding" pulse mode locking under various conditions. Frequency modulation and pulse shape are investigated; new theoretical approaches are discussed to make it possible to understand the mechanism underlying the generation of very short pulses and to find optimum conditions for obtaining such pulses. Pulses propagating in one direction in the resonator are examined. It is demonstrated that the cross-effects between pulses that move in opposite direction and meet in a saturated absorber can be accounted for approximately by varying one of the parameters in the solutions for a pulse propagating in one direction. Figures 14, references 19 Western. [284-6900]

THEORY OF FREE-ELECTRON LASERS WITH FOCUSING PUMPING FIELD

Leningrad ZHURNAL TEKHNIЧЕСКОY FIZIKI in Russian Vol 54, No 2, Feb 83 (manuscript received 29 Apr 83) pp 299-305

GINSBURG, N. S., Institute of Applied Physics, USSR Academy of Sciences

[Abstract] A nonlinear theory of ubitrons and scatterons with focusing pumping field is investigated for the case of Doppler synchronism. Average electron movement equations are derived. Scattering under normal and anomalous Doppler effect conditions is analyzed. It is noted that since all electron exchange energy with the magnetic field in exactly the same way, there are a number of possibilities for improving the electron efficiency, such as varying the phase velocity of the combination waves along the instrument so that the electrons are always in the retarding phase, and exploiting recuperation of the energy of the electron beam on a collector with lower voltage. BIAXIAL-CRYSTAL LASER WITH WAVEGUIDE RESONATOR

Minsk ZHURNAL PRIKLADNOY SPEKTROSKOPII in Russian Vol 40, No 4, Apr 84
(manuscript received 6 Jun 83) pp 683-686

BOYKO, B. B., VASHKEVICH, I. M., KASHPAR, Ye. A., PETROVICH, I. P., UVAROVA, N. N. and SHKADAREVICH, A. P.

[Abstract] A laser is developed employing a biaxial crystal waveguide resonator. A prototype employing a potassium-gadolinium tungstate crystal activated with neodymium ions is investigated experimentally. The waveguide resonator laser is found to produce approximately the same power as one employing a Fabry-Perot resonator, although the threshold pumping energy of the waveguide laser is somewhat higher. Anisotropy of the crystal properties is found to have a strong influence on the lasing characteristics of the waveguide laser. The use of biaxial-crystal waveguide lasers is recommended in devices with stringent requirements for divergence of the radiation in one plane. Figures 2, references 6 Russian.

InGaAsP/InP INJECTION LASERS EMPLOYING THREE-LAYER WAVEGUIDE

Moscow KVANTOVAYA ELEKTRONIKA in Russian Vol 11, No 3, Mar 84 pp 631-633

VASIL'YEV, M. G., DOLGINOV, L. M., DRAKIN, A. Ye., YELISEYEV, P. G., IVANOV, A. V., KONYAYEV, V. P., SVERDLOV, B. N., SKRIPKIN, V. A., SHVEYKIN, V. I., SHEVCHENKO, Ye. G., SHELYAKIN, A. A. and SHEPEKINA, G. V.

[Abstract] Laser heterostructures with three-layer waveguides based on InGaAsP/InP for injection lasers operating in the 1.3 μm band are developed and investigated. The three-layer waveguide heterostructures are prepared by liquid-phase epitaxy on substrates having lower threshold currents than ordinary two-sided heterostructures. The use of step geometry of the profile of the index of refraction increases the optical limiting parameter significantly, which improves optical mode amplification for the same concentration of the injected carriers. Heterostructures with three-layer waveguides are recommended for use in ordinary injection lasers, as well as lasers with periodic feedback structures in integrated optical devices in which laser radiation must be passed through a waveguide with low losses. Figures 3, references 7: 1 Russian, 6 Western.

(manuscript received 11 May 83) pp 613-616

VLASOV, D. V. and STREL'TSOV, V. N., Institute of General Physics, USSR
Academy of Sciences

[Abstract] The excitation of electromagnetic oscillations in an external cavity filled with a substance having highly selective absorption and strong temperature dependence of the index of refraction is investigated. Steady state generation of electromechanic oscillations is provided by an external monochromatic beam. The energy beam density is analyzed as a function of the intensity of the incident beam, revealing a point at which the intensity of the excited oscillations is bounded, leading to an increase in the coefficient of reflection of the exciting beam from the surface of the entrance pupil of the cavity. Such a system can be employed as an efficient amplitude limiter, or as a nonlinear reflecting element. Figures 1, references 5 Russian.

ENERGY CHARACTERISTICS OF GDL EMPLOYING TRANSITIONS BETWEEN LEVELS OF SYMMETRIC AND DEFORMATION MODES OF CO₂ MOLECULE

Moscow KVANTOVAYA ELEKTRONIKA in Russian Vol 11, No 3, Mar 84
(manuscript received 27 Apr 83) pp 551-559

ISLAMOV, R. Sh., KONEV, Yu. B., KULIKOV, A. O., ODINTSOV, A. I., FEDOSEYEV, A. I. and SHARKOV, V. F., Institute of High Temperatures, USSR Academy of Sciences

[Abstract] The results of experimental investigations of the energy and spectral characteristics of lasing on transitions between levels of coupled modes in a CO₂ GDL are presented, along with analytical data based on numerical solution of a system of kinetic equations for the level population. It is found that a CO₂ GDL can provide substantial energy (approximately 10 J) for a number of long wave transitions between levels of coupled modes. Efficient lasing is provided by sufficiently strong collision coupling between levels in the resonator zone. Efficient lasing requires collision-free flow in the nozzles, and removal of relaxing impurities from the gas. The energy yield can be increased by cascade lasing. Optimum mixture compositions are determined for vibrational transitions in the 16.4-21.2 μm range. Figures 6, references 17: 16 Russian, 1 Western.

[Abstract] The spectral-luminescent properties of YScGaG, YGaG, LaLuGaG, GGG and CdScGaG garnets activated by chromium ions and grown by the Czochralski method are investigated. The connection between the lifetime of the excited state of chromium and the ratio of luminescence intensities is analyzed. A method is proposed for determining the energy gap between the ²E and ⁴T₂ Cr³⁺ levels from the temperature behavior of nonradiative Cr³⁺ → acceptor transfer. A relatively small energy gap value is responsible for the highly efficient nonradiative Cr³⁺ → Nd³⁺ transition in GGG and GdScGaG crystals. The crystals synthesized provide the potential capability of supporting lasing with continuous frequency tuning over a wide spectral range. The findings make it possible to predict the spectral-luminescent properties of different matrices activated by Cr³⁺ ions and coactivated with another impurity (such as Nd³⁺ ions). Figures 6, references 20: 12 Russian, 8 Western.

[Abstract] The photophysical properties of asymmetric polymethine dyes are employed to generate light efficiently with a large red shift. The structural and spectroscopic characteristics of asymmetric polymethine dyes employed are presented, along with their spectral and lasing characteristics. Technical lasing efficiencies of better than 15% are obtained in the 780-850 nm region. Two groups of solvated cations are detected for the series of dyes studied, and the solvate shell of the short-wave solvate is shown to restructure rapidly due to change in the electron structure of the molecules in the excited state. The interaction of the polymethine dye molecules with solutions containing electron-donor groups must be used in explaining spectral and luminescent properties, as well as in realizing active laser media with the required characteristics. [Abstract] Interaction of colliding traveling waves in a ring injection laser is investigated. It is found that the interaction mechanism can result in the generation of both standing and traveling waves. The phase, and hence the frequencies, of the waves are "locked", preventing the occurrence of fields at close frequencies. A possible mechanism for such "locking" may be interaction of fields via inversion in a semiconductor [see A. P. Bogatov et al., KVANTOVAYA ELEKTRONIKA, Vol 10, No 9, 1983, p 1851]. The phenomenon described promotes stabilization of the single-frequency lasing mode in a ring injection laser. Figures 3, references 2 Russian.

LINEAR THEORY OF FREE-ELECTRON LASERS WITH CYLINDRICAL INTERACTION SPACE

Leningrad ZHURNAL TEKHNIЧЕСКОY FIZIKI in Russian Vol 54, No 3, Mar 84 (manuscript received 27 Dec 82, final edition received 13 Jul 83) pp 534-540

KARBUSHEV, N. I., RUKHADZE, A. A. and SHATKUS, A. D., Institute of Physics imeni P. N. Lebedev, USSR Academy of Sciences, Moscow

[Abstract] A linear theory is constructed for a free-electron laser with cylindrical interaction space, a microwave device operating with a tubular

relativistic electron beam. The latter and the waveguide through which it propagates are located in the magnetostatic field of an undulator, this field being established by superposition of a pumping field periodically nonuniform along the waveguide axis on a uniform external field. The characteristic equation for a monoenergetic beam is derived on the basis of perturbation theory, assuming an arbitrary radial profile of electron concentration in the waveguide and an infinitesimally thin electron beam tube. This equation describes stimulated radiation of the waveguide mode and includes natural oscillations of electrons. It is identical to the characteristic equation for O-type devices. Particularly important are the Compton mode of operation with a small space charge and the Raman mode of operation with waveguide mode and beam wave interaction, with corresponding constraints on pumping wave amplitude and electron beam current. Participation of a backward companion wave, generated with or without end reflection, is taken into account, conditions for resonance are established, and the effect of possible parasitic waves is included. On the basis of this analysis, relations are derived for gain, efficiency, and starting current in each mode of operation with no electron concentration or velocity modulation at the entrance to the interaction space, assuming also a sufficiently small dispersion of the longitudinal component of electron momentum so that no ubitron operation in the kinetic mode will occur. References 12: 8 Russian, 4 Western.

CHEMICAL STABILITY AND VIBRATIONAL SPECTRA OF ULTRAPHOSPHATE FIBERS

Leningrad FIZIKA I KHIMIYA STEKLA in Russian Vol 10, No 1, Jan-Feb 84
(manuscript received 17 Aug 82) pp 70-74

DUDKO, G. D., ASLANOVA, M. S., SHIROKOVA, A. V., KHODOVA, N. M. and
SHEVELEVICH, R. S., All-Union Scientific Research Institute of Glass-Reinforced
Plastic and Glass Fiber, Moscow

[Abstract] Rare earth ultraphosphate glass materials are used for the formation of optical fibers. The optical shell of the fiber surface has an organic-silicon content and chemical analysis of water and acid stability and surface hydrolysis makes it possible to estimate phase composition and homogeneity of the fibers. Chemical stability and vibrational spectra of $(R,Nd)P_5O_{14}$ type fibers were studied and components were shown to be close in relative weight. Chemical stability for acid increases from fibers containing Bi to those with Gd, La and Y and this is determined mainly by the relative presence of polyphosphate groups. Infrared spectroscopy showed that there are ultra-, ortho- and polyphosphate groups in the ultraphosphate fiber component. Hydrolysis of the ultraphosphate fiber surface tends to form ortho- and polyphosphates according to infrared absorption spectroscopy. Figures 3, tables 2, references 12: 9 Russian, 3 Western.

LASER SOURCE OF NEUTRAL ATOMS FOR COLLECTIVE-FIELD PARTICLE ACCELERATOR

Leningrad ZHURNAL TEKHNIЧЕСКОY FIZIKI in Russian Vol 54, No 3, Mar 84
(manuscript received 26 Jul 83) pp 527-533

BYKOVSKIY, Yu. A., MIRONOV, V. Ye., SARANTSEV, V. P., SIL'NOV, S. M.,
SOTNICHENKO, Ye. A., TER-MARTIROSYAN, Z. A. and SHESTAKOV, B. A.

[Abstract] Laser sources for collective-field particle accelerators, of ions of almost all chemical elements, operate in deep vacuum (10^{-8} - 10^{-9} torr) and in a strong alternating magnetic field (up to 20 kOe, 50 Hz). Under such conditions a laser source is required to deliver an atom flux of 10^{11} - 10^{12} in pulses of 10-100 ms duration from a target to electron rings. Such a laser source has been designed for the collective-field heavy-ion accelerator at the Joint Institute of Nuclear Research. It consists of a laser, focusing lens, and conical target of the material whose atoms are to be extracted. Both lens and target are placed inside the compressor vacuum chamber, the latter having a window for the radiation from the laser placed outside. The target can be located close to the electron rings for maximum utilization of the emitted atom flux. An electron ring becomes loaded with ions as the atom flux crosses it, preferably toward the end of the flux pulse. The equipment for this purpose is, in its basic variant, laid out with the compressor tube mounted on a support inside the vacuum chamber and the laser source in front of the window on the extension of the compressor tube axis. This construction can be modified for large electron rings, with axicon optics that reshape the incoming laser beam into an annular beam for electron rings with radii longer than 8 cm or by moving the laser source from the axial location to a peripheral location relative to the compressor tube for electron rings with radii of 30-35 cm. These three variants of such a laser source were evaluated in an experimental test stand, with a Q-switched YAG:Nd³⁺ laser (wavelength $\lambda = 1.06$ μm) emitting radiation pulses of 0.06 J energy and 10 ns duration, and with lead, aluminum, iron, or copper used as target material. With the vacuum in the compressor chamber held at the $3 \cdot 10^{-7}$ torr level, the target capability was determined from the change of atom signal amplitude after repetitive laser (radiation)-target(material) interaction at one spot. Target performance characteristics of the four materials, namely the dependence of atom flux density, mean atom concentration, and partial atom pressure on the incident radiation power density, also the angular distribution of atom flux density and the atom flux as function of the number of radiation-target interaction events have been established on this basis. The results of measurements,

accurate within 20%, indicate that the laser source is most effective with lead targets and least effective with copper targets. It produces atom fluxes of almost any chemical element for optimum loading of electron rings, retaining high stability of parameters and high purity through 10^6 interaction events. It is synchronized with the accelerator control. Stray atoms not reaching the electron rings condense on the compressor chamber walls and on other surfaces so as not to degrade the vacuum. All components are easily interchangeable for adaptation to particular chemical elements or to different electron rings, and the laser source can be easily removed for adjustment or repair. The authors thank G. D. Shirkov for helpful discussions and I. Ts. Ivanov for assistance in testing. Figures 9, references 9 Russian. [243-2415]

ENERGY COMPRESSION OF ELECTRON BEAM IN LINEAR ACCELERATOR TO 300 MeV LEVEL

Leningrad ZHURNAL TEKHNIЧЕСКОY FIZIKI in Russian Vol 54, No 3, Mar 84
(manuscript received 6 Sep 82, final edition received 24 Jun 83) pp 518-526

AFANAS'YEV, N. G., BUKI, A. Yu., VLADIMIROV, Yu. V., DOVBNYA, A. N., IVANOV, G. M., KRAMSKOY, G. D., MAKHNENKO, L. A., POLISHCHUK, V. N., RYABNYKH, S. I., SHEVCHENKO, N. G. and SHENDRIK, V. A.

[Abstract] An energy compressor has been developed at the Kharkov Institute of Engineering Physics (UkSSR Academy of Sciences) that is capable of compressing an electron beam at the exit from a linear accelerator to a narrow energy band at the 300 MeV level, with dispersion not exceeding 0.1% without loss of intensity. Its basic components, like those of existing energy compressors in Mainz (FRG) and in Glasgow (UK), are a magnetic debuncher and a high-frequency waveguide with an accelerating compressor segment. The debuncher is a special-purpose achromatic magnet array, for parallel shifting of a relativistic electron beam and reducing its longitudinal dispersion to 0.55%. This is still inadequate for energy compression and, therefore, the existing magnets used for this purpose had to be optimally redesigned to ensure the necessary optical characteristics. The waveguide, a rectangular one with 90x45 mm cross section and flat flanges, transmits power from the last klystron stage of the linear electron accelerator to the accelerating electron-beam compressor. After compression, the electron beam is focused onto an aluminum-foil target inside the scatterer sphere of an SP-95 magnetic spectrometer. This is done by two revolvable sliced magnets, a pulse collimator between them, and a pair of quadrupole lenses. Other components of the system are a directional coupler followed by a controllable power divider and a phase shifter that divert some of the klystron output power from the last stage of the linear accelerator to the compressor. The equipment, built in the process of design optimization and performance evaluation, was tested on 225 MeV and 120 MeV electron beams. Its main characteristics were measured first without and then with the quadrupole lenses. With the lenses, the compressor was found to narrow the energy spectrum to a relative width of 0.065% and 0.1% at the 225 MeV level and the 120 MeV level, respectively, with corresponding 7.7 and 8.3 compression ratios. Energy stabilization in the compressed electron beam, namely a stability factor as high as 10, is attainable during $\pm 0.5\%$ wide energy

fluctuations in the original electron beam. The revolvable magnets can stabilize the position of a compressed electron beam on the target within 0.2 mm/h. The resolving power of the measuring and recording equipment (0.076% rms) depends on the energy dispersion of electrons at the target, on the dimensions of the electron beam, on the kinematic dispersion of the electron yield of a ^{27}Al nucleus in the target material, on the spectrometer capture angle, on aberrations in the spectrometer, on multiple scattering of electrons by the spectrometer exit foil, and on the dimensions of the scintillation detector behind the spectrometer. The authors thank V. A. Azhippo, V. P. Gonchar, Ye. V. Yeremenko, Ye. A. Zubov, Z. M. Kolot, B. V. Mazan'ko, L. D. Saliyu, A. L. Khomich, and N. A. Shumilova for having solved the practical engineering problems. Figures 5, references 8: 5 Russian, 3 Western.

THERMAL RESPONSE OF FIRST WALL IN FACILITY OF TOKAMAK TYPE TO HEAT LOAD DURING PLASMA STRIPPING

Leningrad ZHURNAL TEKHNIЧЕСКОY FIZIKI in Russian Vol 54, No 3, Mar 84
(manuscript received 25 May 82, final edition received 20 May 83) pp 504-510

DIVAVIN, V. A. and MIKHAYLOV, A. Ye., Scientific Research Institute of Electrophysical Apparatus imeni D. V. Yefremov

[Abstract] For the design of the first wall in a thermonuclear facility of the tokamak type, the problem of wear by evaporation after melting is analyzed theoretically in the worst case of plasma stripping with attendant rise of the heat load to levels as high as $(1-2) \cdot 10^8 \text{ W/m}^2$. The basis for the analysis is the "thermal breakdown" model of a semiinfinite body, mathematically described by a nonlinear equation of heat conduction with moving solid-liquid interface and moving evaporation front under appropriate constraints. The corresponding boundary-value problem is solved on the basis of quasi-equilibrium evaporation kinetics and the Knudsen-Langmuir relation, assuming that evaporation occurs at the free surface of the hot liquid phase. Calculations yield the wall surface temperature, the eroded layer thickness, the pressure on the wall, and the fraction of the total heat spent on evaporation as functions of the interaction time over a 20 ms transient period, also the temperature profile across the wall thickness at the end of the heat load pulse. Numerical data obtained for steel, aluminum, and graphite walls agree closely with results of the INTOR project and indicate the necessary wall thickness for a "thin wall with cooling" configuration. EFFECT OF STRONG ELECTROMAGNETIC WAVE ON FORBIDDEN BETA-DECAY OF NUCLEI

Moscow PIS'MA V ZHURNAL EKSPERIMENTAL'NOY I TEORETICHESKOY FIZIKI in Russian
Vol 39, No 6, 25 Mar 84 (manuscript received 24 Jan 84) pp 283-285

AKHMEDOV, Ye. Kh., Institute of Nuclear Energy imeni I. V. Kurchatov

[Abstract] Studies are done on the variation of total probabilities of forbidden beta-decays in the field of a strong monochromatic electromagnetic wave and possibilities are discussed for the removal of forbiddenness by absorption by the nucleus from the wave (or emission into the wave) of dipole quanta transferring a certain angular momentum to the nucleus and changing the selection rules. This research is discussed and found insufficient. The power of present-day electromagnetic radiation sources is shown to be below the level required to cause appreciable variation in forbidden beta-decay probabilities. However a strong wave could have an effect on the first forbidden transitions if the maximum laser intensity could be raised by two orders of magnitude which would increase the probability of the process by approximately 10% but considerable technical difficulties would have to be overcome. [Abstract] In certain thermonuclear reactor projects it is proposed to use graphitic carbon shielding materials that will be subjected to irradiation by fluxes of fast neutrons ($E = 14.1$ MeV) and alpha-particles ($E = 3.52$ MeV). The damage resulting from bombardment was studied by irradiating material samples at a temperature of 200°C in a nuclear reactor (neutrons with energy of more than 0.18 MeV) and in a cyclotron (alpha-particles with $32-40$ MeV). Graphitic carbon damage was evaluated and depends significantly only on the graphite structure when the weakly-bound layer configuration is modified and changes occur in characteristics and dimensions. Significant changes in electrical characteristics (resistivity) occur but their role was not evaluated for damage effects which are less important than mechanical and thermal events. Computations are given for thermal events in the lattice during the passage of high-energy alpha-particles that lose energy by ionization and collision leading to graphite temperature rise to 1200°C and annealing, thus reducing damage which is shown to be less than forecast. SHURYGIN, R. V., Institute of Atomic Energy imeni I. V. Kurchatov

[Abstract] Effective heating of hydrogen plasma at the fundamental ion
cyclotron frequency is detected on the TO-2 tokamak installation. No
significant influence on plasma containment or purity was noted. The Q of
the intrinsic modes was less than 50, and was independent of the longitudinal
wave number K_z . The strong cyclotron absorption observed is assumed to be
associated with an increase in the left-polarized field of the fast magnetosonic
wave due to heterogeneity of the magnetic field and the real drift trajectories
of the ions in the tokamak. Figure 1, references 4: 1 Russian, 3 Western.

MEASUREMENT OF DISPERSION OF ANGULAR SPREAD OF ELECTRON BEAM IN CYCLIC
ACCELERATORS BY SYNCHROTRON RADIATION

Moscow PRIBORY I TEKHNIKA EKSPERIMENTA in Russian No 1, Jan-Feb 84
(manuscript received 11 Jan 83) pp 34-37

GUK, I. S. and GLADKIKH, P. I., Kharkov Physical-Technical Institute

[Abstract] A method is described for determining the local dispersion of the
vertical angular distribution of the electron beam at one point in the
magnetic system of an accelerator or accumulator without disturbing the beam
by measuring the angular distributions of the π -component of the synchrotron
radiation. Analysis of the vertical electron beam spread during perturbation
by vertical betatron oscillations shows the proposed method to be highly
accurate throughout the magnetic system of the accelerator. Figures 5,
references 9 Russian.

(manuscript received 22 Nov 82) pp 30-34

PANASYUK, V. S., TERESHKIN, Yu. M. and KHROMCHENKO, V. B.

[Abstract] An electron synchrontron is described in which the cyclotron preaccelerator is a resonance device in which the functions of the electro-magnet and resonator are combined in a single unit. The pulsed magnetic field is excited by a single-winding electromagnet whose internal cavity serves simultaneously as a resonator. The electron source is the plasma of the axis of the resonator created with the help of an erosion plasma source. The arrangement of the microwave section of the accelerator is analyzed, and the maximum intensity of the accelerator beam is estimated. Figures 5, references 11: 10 Russian, 1 Western.

INERTIAL THERMONUCLEAR FUSION REACTORS (A REVIEW)

Moscow KVANTOVAYA ELEKTRONIKA in Russian Vol 11, No 3, Mar 84
(manuscript received 1 Nov 82; revised 15 Aug 82) pp 439-457

KALININ, A. V., All-Union Scientific Research Center for the study of surface and vacuum properties

[Abstract] The current status of inertial thermonuclear fusion engineering is reviewed. The state of physical research in the laboratory is discussed. Inertial fusion reactor development and employment for power generation are stressed. Lasers are singled out as the best of all existing initiation systems. The stage of physical laboratory research on laser thermonuclear fusion is now over, and the conceptual design of laser fusion reactors is basically finished. The scientific foundation has now been laid for the design of a demonstration fusion reactor, to be followed by development on an experimental commercial scale. The prerequisites have now been met for developing a long range integrated program for the development of a laser thermonuclear powerplant. Figures 6, references 50: 14 Russian, 36 Western.

NMR ANALYSIS OF ATOMIC STRUCTURE IN AMORPHOUS IRON-BORON ALLOYS

Moscow DOKLADY AKADEMII NAUK SSSR in Russian Vol 275, No 1, Mar 84
(manuscript received 3 May 83) pp 79-83

POKATILOV, V. S., Central Scientific Research Institute of Ferrous Metallurgy
imeni I. P. Bardin, Moscow

[Abstract] The local atomic structure of iron-boron alloys was studied by an
NMR method that yields information about the environment of a given atom
rather than average characteristics of a structure. Specimens of alloys with
a 13.5-25.0 atom.% B content were produced by rapid quenching of the melt on
a rotating copper disk. Specimens with 15 and 22 atom.% B were annealed
successively at 280, 360, and 400°C for 60 min at each temperature, then at
510°C for 5, 15, 30, and 60 min respectively. Specimens with 15 atom.% B
were finally annealed at 575°C for 30 and 60 min respectively. Both x-ray
diffraction analysis and NMR analysis were performed after quenching and after
subsequent annealing. The results give the dependence of the hyperfine magnetic
field and the evolution of resonance spectra at ^{11}B nuclei on the boron con-
centration, revealing some asymmetry in quenched Fe-B alloys, on the low-
frequency side in Fe- 15 atom.% B and on the high-frequency side in Fe-
22 atom.% B. Low-temperature annealing (280-360°C) causes the spectral peak
to shift toward higher frequencies, while high-temperature annealing (400°C)
gives rise to faint lines corresponding to orthorhombic and tetragonal Fe_3B
phases. Low-temperature annealing results in structural relaxation through
redistribution of atoms in the amorphous matrix. In quenched Fe-B alloys the
boron atom is surrounded by 9 iron atoms, the short-range order relative to
the boron atom being chemically the same in all alloys but being topologically

dependent on the boron content. This model explains the characteristics of various properties such as the concentration dependence of the average magnetic moment of iron atoms. Article was presented by Academician G. V. Kurdyumov on 27 Apr 83. Figures 4, references 11: 4 Russian, 7 Western.

EFFECT OF HYDROGEN ON FORMATION OF ENERGY SPECTRUM OF MULTIPLY CHARGED AND COPPER IONS

Tashkent IZVESTIYA AKADEMII NAUK UZ SSR: SERIYA FIZIKO-MATEMATICHESKIKH NAUK in Russian No 1, Jan-Feb 84 (manuscript received 13 Jan 82) pp 55-57

BEDILOV, M. R. and SABITOV, M. S., Institute of Physics, UzSSR Academy of Sciences

[Abstract] The effect of hydrogen on the energy spectrum of carbon and copper ions of a laser multielement plasma was studied. Copper and polyethelene served as hydrogen-bearing targets. Laser radiation was used for ionization with a laser time-of-flight spectrometer and electrostatic analyzer instrumentation. It was shown experimentally that as hydrogen concentration in the targets increased there was a significant variation in the charge factor and width and characteristics of the copper and carbon and a special feature of the hydrogen spectrum was observed. Independently of the nature of the target, the width of the hydrogen spectrum increases with laser power until the latter reaches an optimum above which the spectrum narrows and disappears. The feature also depends upon hydrogen concentration which agrees with chemical data. Analysis of hydrogen, carbon and copper energy spectra shows differences with the hydrogen spectra narrower in the main and low range (to 350 eV) while the carbon and copper have broad spectra in high energy regions to several keV. Laser power selection can thus separate hydrogen from the multielement plasma and increase the intensity of copper and carbon ions. Figures 4, references 3 Russian.

HOLOGRAPHIC SUBTRACTION OF IMAGES BY FOURIER PLANE RECORDING AND SPATIAL FILTRATION WITH A NARROW BEAM

Moscow DOKLADY AKADEMII NAUK SSSR in Russian Vol 272, No 2, Sep 83 (manuscript received 17 Mar 83) pp 365-369

KLIMENKO, I. S., MALOV, S. N. and RYABUKHO, V. P., Moscow Physicotechnical Institute

[Abstract] Known methods for holographic image subtraction based on phase-shift elements encounter technical problems. Utilization of optical spectra overcomes some difficulties but images have a low brightness because of small

aperture spatial filtration at the interference field minima. The paper describes a simple holographic subtraction method giving a good level of image brightness consisting in obtaining double exposure Fourier holograms recording two separate images with a small shift of the object in the transverse direction between exposures and illumination of the hologram with a small diameter laser beam with subsequent optical Fourier transformation of the reconstructed field. An experiment was done involving images of a piece of chalk taken before and after the microrelief had been mechanically destroyed. Image formation was carried out with an insignificant noise background but the frying noise involved in the use of the small diameter beam was high and limited resolution of dimensions of up to approximately 0.05 mm. Image brightness was approximately two orders better than for a comparable method. Figures 2, references 4 Western.

ROLE OF MULTIPLE SCATTERING IN TURBIDIMETRIC INVESTIGATIONS OF DISPERSE SYSTEMS

Minsk ZHURNAL PRIKLADNOY SPEKTROSKOPII in Russian Vol 40, No 2, Feb 84
(manuscript received 18 Oct 82, revised 28 Jun 83) pp 320-323

KHLEBTSOV, N. G.

[Abstract] The role of multiple scattering in turbidimetric experiments conducted on series-produced instruments is studied theoretically. The model employed is the standard model of the theory of radiation transfer in an unbounded plane layer which is struck perpendicular to the boundary by an ideally collimated light flux. It is demonstrated possible to disregard optical density distortion due to multiple scattering; turbidimetric measurements are shown to be insensitive to multiple scattering, thus validating the use of methods for solving the inverse problems developed for the approximation of single scattering to describe real systems. (manuscript received 7 Apr 83) pp 315-324

KOLILEVICH, Yu. I. and SOCHILIN, G. B.

[Abstract] The statistical characteristics of light beams reflected from a flat mirror, corner or mirror-lens reflector and a 90-degree prism are compared. The smooth perturbation method is used to compute the correlation function of the fluctuations in the phase, angles of arrival, amplitude levels and dispersion of random shifts in the center of gravity of a gaussian beam reflected in a random heterogeneous medium. Expressions are derived for the correlation of the angles of arrival and dispersion of the random shifts of the center of gravity of the reflected beam, and for the dispersion of the shifts of the center of gravity of the location image of the reflector in the focal plane of a receiving lens combined with the transmitting aperture. The influence of diffraction effects on the dispersion of lateral shifts in the center of gravity of the reflected beam is illustrated. Figures 5, references 16: 15 Russian, 1 Western.

LONGITUDINAL SHIFTING AND SPLITTING OF LIGHT BEAM REFRACTED ON BOUNDARY WITH ISOTROPIC ABSORBING MEDIUM

Minsk ZHURNAL PRIKLADNOY SPEKTROSKOPII in Russian Vol 40, No 3, Mar 84 (manuscript received 31 May 78; revised 14 Oct 83) pp 493-496

FILIPPOV, V. V.

[Abstract] The plane wave approach is used to analyze longitudinal displacement and splitting of a light beam refracted on the boundary with an absorbing

medium. Two cases are considered: with the electric field of the incident wave oscillating in the plane of incidence, and perpendicular to that plane. Splitting of the light beam is analyzed as a function of the angle of incidence. The plane wave approximation cannot be used when there is a significant amount of splitting because of the sharp reduction in the aperture of the beam and the absorbing medium due to refraction of the boundary. References 8: 4 Russian, 4 Western.

SPACE-ANGLE STRUCTURE OF LIGHT BEAM IN VERTICALLY HETEROGENEOUS SCATTERING MEDIUM

Minsk ZHURNAL PRIKLADNOY SPEKTROSKOPII in Russian Vol 40, No 3, Mar 84
(manuscript received 1 Dec 82) pp 465-471

VALENTYUK, A. N.

[Abstract] Formulas are derived that describe the space-angle structure of a light beam in a heterogeneous scattering medium in which the scattering parameters fluctuate arbitrarily. The sought solution is obtained as an expansion with respect to a small parameter associated with the scattering index, and includes the region of small and large scattering angles. The method developed can be used for layers of any thickness, since the characteristics of radiation reflected from an optically thick layer in which absorption occurs are determined basically by the parameters of a fairly thin surface layer within which the formulas for the small-angle approximation are satisfied. INVESTIGATION OF RAMAN SPECTRA OF $\text{Nd}_3\text{Ga}_5\text{O}_{12}$ SINGLE CRYSTALS

Minsk ZHURNAL PRIKLADNOY SPEKTROSKOPII in Russian Vol 40, No 3, Mar 84
(manuscript received 13 Dec 82) pp 413-418

NOSENKO, A. Ye., BILYY, A. I. and ARTAMONOV, V. V.

[Abstract] The characteristics of the Raman spectra of neodymium-gallium garnet single crystals are investigated with the help of a DFS-24 spectrometer at 80 and 300 K. LG-38 and LG-70 He-Ne and He-Cd lasers were employed in a standard 90-degree experimental geometry. The Raman spectra were excited at 440-455 nm and 640-670 nm. The spectra lines are more clearly defined in the shortwave region than in the longwave region at room temperature, and dropping the temperature to 80 K makes the lines narrower, shifts them to the lower frequency

region and causes a number of new lines to appear in the spectrum. The relative intensity of the high frequency lines ($400-700\text{ cm}^{-1}$) is somewhat higher than at room temperature. The frequencies and types of symmetry of phonon vibrations are established. Figures 2, references 15: 7 Russian, 8 Western.

INVESTIGATION OF PROCESSES UNDERLYING DEACTIVATION OF ELECTRON EXCITATION OF NEODYMIUM IN NON-ALKALINE SILICATE GLASSES

Minsk ZHURNAL PRIKLADNOY SPEKTROSKOPII in Russian Vol 40, No 4, Apr 84
(manuscript received 10 Jan 83) pp 640-648

MALASHKEVICH, G. Ye.

[Abstract] The luminescence kinetics of non-alkaline silicate glasses is investigated in detail in order to find the values of the microparameters of the extinction and migration interactions of neodymium ions, the minimum possible distance between them and the quantum yields the different metastable state deactivation mechanisms. Decomposition is found to be near exponential for low neodymium concentrations. As the neodymium concentration increases, the temporal behavior of the luminescence intensity becomes highly nonexponential. Mathematical expressions are derived for estimating the values of the microparameters that determine the rate of nonradiative deactivation of the metastable state of neodymium ions. Resonant cross-relaxation interactions of neodymium ions on deactivation of the metastable state are found to be characteristics for neodymium glasses. The quantum luminescence yield of these glasses at low activator concentrations is found to be fairly high. The relationship between donor-donor and donor-acceptor microparameters and the ratio of the vitrifying components discovered makes it possible to improve the luminescent characteristics of such glasses by optimizing their composition. EXPERIMENTAL INVESTIGATION OF SCATTERING OF LIGHT BY LARGE "SOFT" OPTICALLY ISOTROPIC ASPHERICAL PARTICLES

Minsk ZHURNAL PRIKLADNOY SPEKTROSKOPII in Russian Vol 40, No 4, Apr 84
(manuscript received 26 Nov 82) pp 630-634

DUBOVA, G. S., KOROLEVICH, A. N. and KHAYRULLINA, A. Ya.

[Abstract] The spectral behavior of the indices of refraction and attenuation of disks and spheres of equivalent volume with optical constants n and k ranging from 1.05 to 1.06 and 10^{-3} to 10^{-5} , respectively, are investigated

experimentally in the 0.4-1.0 μm range. The scattering indices within the region of angles $1^\circ \leq \gamma \leq 20^\circ$ and $90^\circ \leq \gamma \leq 140^\circ$ are investigated in detail. The indices of attenuation and absorption are measured spectrally by an SFD-2 spectrophotometer. The particle absorption cross section is found to depend little upon shape. Scattering indices are tabulated for various optical constants and particle microstructural parameters. Figures 3, references 17: 8 Russian, 9 Western.

LABORATORY INVESTIGATION OF COEFFICIENTS OF ABSORPTION OF AIR AT $\lambda=10.6 \mu\text{m}$

Minsk ZHURNAL PRIKLADNOY SPEKTROSKOPII in Russian Vol 40, No 4, Apr 84
(manuscript received 7 Dec 82) pp 599-604

TOPORKOV, Yu. G.

[Abstract] The coefficients of absorption of air are determined at $\lambda=10.6 \mu\text{m}$ in order to establish the contribution of different gaseous components to the overall coefficients of attenuation (absorption) and to assess aerosol influence. The experimental setup is described in detail. The recorded coefficient of attenuation of air is analyzed as a function of absolute humidity for different laser powers. The coefficients of absorption due to aerosol are found to be significant against the background of the gaseous component. Figures 3, references 16: 10 Russian, 6 Western.

OPTICAL CONSTANTS OF AQUEOUS SOLUTIONS OF PHOSPHORIC ACIDS IN 0.4-14 μm SPECTRAL REGION

Minsk ZHURNAL PRIKLADNOY SPEKTROSKOPII in Russian Vol 40, No 4, Apr 84
(manuscript received 11 Jan 83) pp 579-583

AL'PEROVICH, L. I., KOMAROVA, A. I., OZERENSKIY, A. P., SIDOROV, A. I. and SHPITKO, L. V.

[Abstract] The optical constants of aqueous solutions of phosphoric acids are investigated by measuring the transmission spectra of the investigated liquids to gain information regarding optical properties. The transmission spectra of thin plane-parallel layers of solutions 4-8 μm thick contained between flat calcium fluoride plates are measured. The spectrum of the index of refraction is calculated by the Kramers-Kronig method. The spectra of the index of absorption and refraction of orthophosphoric acid are analyzed. The method can be recommended for a solution of any acid in any concentration within the range of concentrations studied. Figures 3, references 8: 6 Russian, 2 Western.

SPECTROSCOPIC INVESTIGATIONS OF POLYMER PHOTOTROPIC MEDIA EMPLOYED FOR CONTROLLING LASER RADIATION

Minsk ZHURNAL PRIKLADNOY SPEKTROSKOPII in Russian Vol 40, No 4, Apr 84
(manuscript received 29 Dec 82) pp 555-560

YEREMEYEVA, Ye. P., OVCHINNIKOV, V. M., ARKHIPOV, V. P., IVANOVA, T. F.,
PITERKIN, B. D. and SMIRNOVA, Z. A.

[Abstract] Spectrophotometry and radio spectroscopy are used to investigate changes in the physicochemical characteristics of polymers and polymethane-based polymer phototropic media with absorption band in the 1.0-1.3 μm region caused by radiation: coherent-resonant ($\lambda=0.16 \mu\text{m}$) and nonresonant ($\lambda=0.694 \mu\text{m}$) and incoherent ionizing--ultraviolet and gamma radiation of ^{60}Co . Neodymium glass and ruby lasers in the single pulse mode served as coherent radiation sources. The resistance of polymer films and polymer phototropic media to laser radiation is investigated, and the change in the spectral characteristics of polymer phototropic media caused by ionizing ultraviolet and gamma ^{60}Co radiation are studied. Figures 3, references 9 Russian.

SPATIAL COHERENCE FUNCTION, MODE COMPOSITION AND MODE FIELD STRUCTURE OF LASER RADIATION

Minsk ZHURNAL PRIKLADNOY SPEKTROSKOPII in Russian Vol 40, No 4, Apr 84
(manuscript received 31 Jan 83) pp 546-550

ZAMOTRINSKIY, V. A., KOVALENKO, Ye. S., KOLCHINA, G. A. and SHANGINA, L. I.

[Abstract] The possibility of determining resonator modes on the basis of expanding the spatial coherence function of the radiation with respect to coherent components is discussed. The case of a steady state process in which there are not mode locking effects is investigated. Mode recovery is investigated for a lossless plane resonator, a lossless spherical resonator and a lossy plane resonator. It is demonstrated that the spatial coherence function can be used to find the mode composition of radiation as well as the field structure of the individual modes. The differences between the recovered and initial field in lossy resonators are found to be regular and fundamental. Figures 2, references 7: 5 Russian, 2 Western.

ATOMIC FLUORESCENCE METHOD FOR DETERMINING ALKALI METAL VAPOR CONCENTRATION WITH USE OF LASER SOURCE

Minsk ZHURNAL PRIKLADNOY SPEKTROSKOPII in Russian Vol 40, No 4, Apr 84
(manuscript received 27 Dec 82) pp 533-536

BUDKIN, L. A., OKHOTNIKOV, O. G., PAK, G. T., PIKHTELEV, A. I. and PUZANOV, S. L.

[Abstract] An atomic fluorescence method for determining the concentration of alkali metal vapor by using a laser source is examined using cesium atoms as an example. A GaAlAs semiconductor laser source was employed. The fluorescence signal was recorded in the direction perpendicular to the laser beam. A system of balance equations corresponding to a three-level approximation of the quantum structure of alkali metal atoms is derived to determine the quantitative relation between the fluorescence signal and atom concentration. The experimental results agree well with the theoretical calculations for cesium vapor. Figures 3, references 12: 11 Russian, 1 Western.

INTERNAL FIELD OF WATER DROPLET AT 3.39-10.6 μm LASER WAVELENGTHS

Leningrad OPTIKA I SPEKTROSKOPIYA in Russian Vol 56, No 1, Jan 84
(manuscript received 30 Dec 81) pp 128-131

LOSKUTOV, V. S. and STRELKOV, G. M.

[Abstract] The internal field in water droplets at laser wavelengths of 3.39-10.6 μm is investigated for diffraction parameter values of up to approximately 900 in order to identify the conditions under which internal field maxima are formed and disappear as droplets consolidate. The internal field in absorbing water droplets is found to be highly irregular; explosive decomposition of absorbing droplets, analogous to that observed in experiments with weakly absorbing droplets, is possible over a wide range of radii. The pulse energy required for explosive droplet decomposition is estimated. Figures 3, references 11 Russian.

TYPES OF OSCILLATIONS IN RESONATORS WITH MIRRORS THAT PRODUCE PARTIAL PHASE CONJUGATION

Moscow KVANTOVAYA ELEKTRONIKA in Russian Vol 11, No 3, Mar 84
(manuscript received 24 May 83) pp 591-597

BEL'DYUGIN, I. M. and ZOLOTAREV, M. V.

[Abstract] The matrix approach is employed to investigate the influence of frequency shift, amplitude and phase distortions on the behavior of vibration modes in a resonator incorporating phase-conjugate mirrors. It is found that different factors that determine phase-conjugate reflection have different influence on formation of modes of oscillations in a resonator with phase-conjugate mirrors. It is found that when the phase distortions are not excessive, diffraction on the aperture of the mirror retards the modes of the resonator in the stable region, and the role of phase distortions consists only of deforming these modes. The findings indicate that the transverse dimensions of modes of oscillations can be controlled by introducing different types of distortions in the mirror. It is shown that special measures can be taken to make resonators incorporating mirrors equivalent to an unstable resonator, with all of the advantages of the latter, while providing output radiation insensitive to optical distortions in the active medium. Figures 2, references 6: 3 Russian, 3 Western.

GERASIMOV, V. A., PROKOL'YEV, V. Ye., SOKOVIKOV, V. G. and SOLDATOV, A. N.,
Institute of Atmospheric Optics, Siberian Department, USSR Academy of Sciences

[Abstract] Rare-earth elements with comparatively low evaporation points are investigated in order to obtain emission in the visible portion of the spectrum by exciting their vapors in a pulsed gas discharge. The experimental setup is described. Emission lines are obtained in the orange ($\lambda=589.948$ nm) and near IR ($\lambda=1101.1$ nm) regions of the spectrum. The thulium atom, which has the lowest metastable and upper levels, is found to be the best rare earth element for providing emission in the visible region of the spectrum. Figure 1, references 8: 5 Russian, 3 Western.

INCREASING LIGHT TRANSMISSION IN DIRECTION OF DEPOSITION OF SUSPENSION OF TURBID MEDIA DURING PRECIPITATION

Leningrad PIS'MA V ZHURNAL TEKHNIЧЕСКОY FIZIKI Vol 10, No 7, 12 Apr 84

(manuscript received 2 Jan 84) pp 394-397

ASKAR'YAN, G. A., Institute of General Physics, USSR Academy of Sciences

[Abstract] Transmission of light completely through a precipitating substance, through the entire turbid medium in the direction of precipitation

including the layers of increasingly dense precipitate, is investigated. An experimental setup is described that incorporates an LG-75 helium-neon laser radiating through a vessel containing the precipitating liquid. The turbid medium consisted of corundum powder in water. The proposed approach can be used to irradiate biological media in view of the possible intensification and acceleration of precipitation by artificially enhanced gravity (centrifugal and inertial means). FIBER CABLE IN OPTICAL SYSTEM WITH BRIGHTNESS AMPLIFIER

Moscow DOKLADY AKADEMII NAUK SSSR in Russian Vol 274, No 6, Feb 84
(manuscript received 10 Aug 83) pp 1373-1376

ALEYNIKOV, V. S., corresponding member, USSR Academy of Sciences, BUNKIN, F. V., DIANOV, Ye. M., ZEMSKOV, K. I., KAZARYAN, M. A., PETRASH, G. G., academician PROKHOROV, A. M. and SAVRANSKIY, V. V., Institute of Physics imeni P. N. Lebedev, USSR Academy of Sciences, Moscow

[Abstract] Two basically different principles of image transmission over optical fiber cables as light guides in optical systems with brightness amplifiers are feasible, namely transmission of the original image from object to amplifier or transmission of the amplified image. The first principle can be implemented with the brightness distribution at the cable entrance either shaped directly without the aid of optics or preshaped by a lens, with respectively

a solid object-cable contact or a longer segment of stiff fiber cable required. A comparative evaluation of these three schemes reveals that gain is highest in the third and lowest in the first, resolution is equally high and field of vision is equally large in both, resolution being lowest and field of vision being smallest in the second scheme. CRYOLUMINESCENCE OF LIQUIDS

Moscow DOKLADY AKADEMII NAUK SSSR in Russian Vol 275, No 1, Mar 84
(manuscript received 19 May 83) pp 83-86

TROKHAN, A. M., LAPSHIN, A. I. and GUDZENKO, O. I., All-Union Scientific Research Institute of Physicotechnical and Radiotechnical Measurements, Mendeleyevo, Moscow Oblast

[Abstract] Spontaneous luminescence during fast freezing and cooling, originally discovered in solutions of lanthanide salts, was also recorded in an experiment with over 100 translucent tinted fluids including pure and sea water, organic and inorganic solvents, solutions, mixtures, and melts. Tests were performed in a Dewar flask with transparent walls containing 4.5 cm³ specimens and cooled at various rates with liquid nitrogen or its cold vapor. Freezing was recorded by a change in electrical conductivity, glow flashes were recorded with a photomultiplier, and the temperature was measured with a Chromel-Alumel thermocouple. The results reveal that excitation of cryoluminescence requires a sufficiently high cooling rate, 0.1-30°C/s depending on the substance. The glow process is a sequence of separate pulses with shorter than 0.1 s extinction time and repetition rate of 10⁻¹-10² Hz depending on the substance. According to the character of glow kinetics, described by curves of glow intensity as a function of time, all substances fall into three type: 1) with distinct separate glow peaks (water, aqueous solutions, acetone); 2) with densely packed glow peaks (alcohols, organic acids, ethers); 3) with glow peaks superposed on a flat glow level representing the "tails" of individual peaks (methoxy compounds). The time distribution of cryoluminescence depends also on the initial temperature and aggregation of a substance, the glow intensity being higher for a substance that is liquid before cooling than for a substance that is solid before cooling, and the glow intensity decreasing rapidly as the initial temperature drops below the melting point. The results of this study indicate that electrical phenomena such as piezoelectric and pyroelectric effects as well as charge segregation on fresh surfaces and movement of charged dislocations in the solid phase, all associated with mechanical stresses in rapidly forming crystals, play a significant role in excitation of cryoluminescence analogous to acoustic emission during cracking and to radio emission. Microinclusions with metastable structure and unstable ions or radicals also contribute to cryoluminescence. Article was presented by Academician S. A. Khristianovich on 13 Apr 83. Figures 3, references 4: 3 Russian, 1 Western.

ANDRIYESH, A. M., VYKOVSKIY, Yu. A., BORODAKIY, Yu. V., MIRONOS, A. V., SMIRNOV, V. L. and PONOMAR", V. V., Moscow Engineering-Physical Institute

[Abstract] The possibility of using optical methods to produce a complex profile of the index of refraction in optical fibers based on chalcogenide glass is studied. Optical fibers of As_2S_3 up to 800 μm in diameter produced by vacuum drawing were employed. The index of refraction of the fiber core at 0.7 μm is close to 2.48, and can vary depending upon the stoichiometric composition of the fiber material and the method by which it is prepared. The profile of the index of refraction occurring when a chalcogenide glass optical fiber is exposed to an argon laser beam is examined. The proposed method can be used to create analogs of integrated optical elements such as couplers, multiplexers, modulators, etc. The method can be used to record holograms and diffraction gratings on chalcogenide glass in order to produce efficient devices for data processing, matching, demultiplexing, diffraction-type deflectors, etc. Figures 2, references 8: 6 Russian, 2 Western. [Abstract] The results of initial experiments on controlled nonlinear adjustment of the envelope of a picosecond laser pulse in an optical light guide are presented. The ultrashort pulse source was a passive mode-locked YAG laser. The change in form and duration of asymmetric ultrashort pulses 25 ± 2 and 31 ± 2 ps long at the fiber input were investigated. Pulse symmetrization is shown to be associated with two types of spectral deformation: spectral

broadening during nonstationary absorption in the thin-film gate, and self-modulation of the pulse in the fiber. Decreasing the attenuation decrement of the absorber increases the phase velocity of the signal. The role of initial modulation is shown to be more significant in the evolution of short pulses than of long ones. Part of the trailing edge of long pulses remains unmodulated, which exacerbates the tendency toward pulse spreading. References 5 Russian. [267-6900]

LINEAR MOVEMENT MEASURING SYSTEMS WITH ACOUSTOOPTICAL MODULATORS

Leningrad PIS'MA V ZHURNAL TEKHNIЧЕСКОY FIZIKI in Russian Vol 10, No 6, 26 Mar 84 (manuscript received 9 Jan 84) pp 330-334

LEMANOV, V. V., MALAMED, Ye. R., SKVORTSOV, Yu. S., YUSHIN, N. K. and YAKHKIND, E. Z.

[Abstract] Two systems for measuring linear movements are described, one providing increments of 0.01-0.02 μm and a range of up to 100 mm, which is used in manufacturing VLSI chips, and the other of which provides increments of 0.1-0.2 μm and has a range of up to 1200 mm. Both systems employ solid state STF-2 (STF-376) glass modulators and are fully automated. The sensitivity of these devices is doubled by using a prism to obtain a signal corresponding to a single-period change in phase by shifting the raster by half a period. TRANSFER FUNCTION OF MULTILAYERED MAGNETOOPTICAL SPACE-TIME MODULATOR

Leningrad ZHURNAL TEKHNIЧЕСКОY FIZIKI in Russian Vol 54, No 1, Jan 84 (manuscript received 6 Apr 83) pp 115-119

PETROV, M. P. and BELOTITSKIY, V. I., Physical-Technical Institute imeni A. F. Ioffe, USSR Academy of Sciences, Leningrad

[Abstract] The transfer function and pulse response of a multilayered magneto-optical space-time optical modulator operating in the linear mode are found. The transfer function is found to be axisymmetric if the first layer is magnetized along the Oz axis. When the spatial frequencies are high, the absolute value of the gain drops off as $\exp(-b\gamma)$. A fundamental feature of magneto-optical space-time optical modulators is the suppression of zero-order spatial frequencies. If magnetic recording tape is used as the first layer, it is currently possible to input data to an optical circuit at up to $8 \cdot 10^5$ bits/cm². The low coercivity of epitaxial layers of ferrite garnets makes it possible to obtain dynamic ranges exceeding 40 dB. Figures 3, references 10 Russian. [197-6900]

HARMONIC DISTORTIONS IN OPTICAL FIBER COUPLERS DURING DIGITAL INFORMATION TRANSMISSION

QUANTUM RESTRICTION OF ELECTRON-OPTICAL METHOD OF INVESTIGATING FAST PROCESSES

Leningrad ZHURNAL TEKHNIЧЕСКОY FIZIKI in Russian Vol 54, No 1, Jan 84
(manuscript received 28 Mar 83) pp 51-55

BULYGIN, V. S.

[Abstract] The temporal resolution of the electron-optical method is examined from a quantum viewpoint. The relationship between the durations of the wave packets before the after amplification by an electron-optical transducer is derived. The shortest pulse length that the transducer can register, which is determined by quantum mechanical spreading, is found. When the accelerating field intensity is high, the quantum mechanical limit will restrict the temporal resolution of the transducer to that level already determined by other factors, such as the sweep rate or kinetics of photoemission from the photocathode of the transducer. (manuscript received 8 Feb 83) pp 19-31

KOSOBUKIN, V. A. and SAMSONOV, A. M., Physical-Technical Institute imeni A. F. Ioffe, USSR Academy of Sciences, Leningrad

[Abstract] The reflection of an electromagnetic wave from a multilayer system is studied during nonlocal perturbation of permittivity in a microscopically

thin "layer" on one of the interface boundaries. The zero-order approximation in constructing the perturbation theory in this case is the electrodynamics of solid media with abrupt boundaries. The perturbation method employed makes it possible to assess the contribution of approximation of different order and can be used to describe many optical phenomena. The first-order corrections are computed for the electromagnetic field and the coefficients of reflection, since these contain the basic perturbation information. A three-layer plane-parallel dielectric medium is examined in the zero-order approximation. Disturbed total internal reflection is discussed with allowance for molecules adsorbed on metal. A model is presented and discussed. Figure 1, references 20: 6 Russian, 14 Western.

[Abstract] A long-wave holographic system with circular aperture is considered for formation of radio images. Its indeterminacy function is derived from the geometrical relations, taking into account scattering. A circular aperture of radius R is compared with a square one of area $2R \times 2R$, their performance being evaluated in terms of resolution with half-width of the principal peak of the indeterminacy function at base (zero) level as criterion. Complete reconstruction of an image $I = B(x_s, y_s)$ upon interchange of coordinates is found to be feasible, owing to the filter property of the Bessel function J_0 . Calculations reveal that a circular aperture is more efficient than a square one, inasmuch as it requires π times fewer samples along one coordinate. Article was presented by Academician (BSSR Academy of Sciences) M. A. Yel'yashevich. Figures 2, references 3 Russian.

NUMERICAL INVESTIGATION OF CHARACTERISTICS OF CURRENT FLOW FOR DIFFERENT METHODS OF OBTAINING DISCHARGE IN HIGH SPEED LASERS. MECHANISM UNDERLYING CURRENT FLOW IN POSITIVE GLOW DISCHARGE COLUMN

Moscow TEPILOFIZIKA VYSOKIKH TEMPERATUR in Russian Vol 21, No 5, Sep-Oct 83 (manuscript received 20 Dec 82) pp 865-870

BREYEV, V. V., DVURECHENSKIY, S. V. and PASHKIN, S. V.

[Abstract] Positive glow discharge columns are examined for different methods at obtaining discharge from the viewpoint of the model of a nonstationary plasma; the roles of detachment and the heterogeneity factor are investigated in various experiments to study elementary discharge processes. Experimental data are interpreted from this viewpoint as well. The study includes steady-state self-maintained and semi-self-maintained alternating current, as well as discharge in a decaying plasma. The mechanism underlying the current flow cannot be described unless allowance is made for heterogeneities in the plasma in the direction in which the current is moving. CALCULATION OF OPTICAL AND ELECTROPHYSICAL CHARACTERISTICS OF ARC DISCHARGES IN ALKALI METAL VAPORS

Moscow TOPLOFIZIKA VYSOKIKH TEMPERATUR in Russian Vol 21, No 4, Sep-Oct 83 (manuscript received 1 Jun 82) pp 858-864

GRADOV, V. M., SHCHERBAKOV, A. A. and YAKOVLEV, A. V.

[Abstract] A mathematical model of a discharge in alkali metal vapors is developed, and material functions are derived that can be used to obtain the real relationships between radiation characteristics of sources and the basic parameters of these sources. The basic electrophysical and radiation characteristics of arc discharges in alkali metal vapors, as well as the optical and transport properties of the plasma, are investigated. Figures 4, references 33: 23 Russian, 10 Western.

COLLISION-FREE SHOCK WAVE IN SUPERSONIC PLASMA FLOW WITH $\beta \approx 1$

Moscow PIS'MA V ZHURNAL ESKPERIMENTAL'NOY I TEORETICHESKOY FIZIKI in Russian Vol 39, No 5, 10 Mar 84 (manuscript received 29 Dec 83) pp 205-207

ARKHIPOV, N. I., ZHITLUKHIN, A. M., SAFRONOV, V. M., SIDNEV, V. V. and SKVORTSOV, Yu. V.

[Abstract] The dynamics of a supersonic collision-free plasma flow with $\beta \approx 1$ in a lengthwise increasing magnetic field is investigated. The experimental setup is described and the distribution of the vacuum magnetic field in the liner is analyzed. The formation of a collision-free shock wave in a supersonic plasma flow compressed in a conical diffuser limits the degree of compression that can be obtained in this way, but allows the mechanism to be used for efficient plasma heating. Figures 2, references 8: 4 Russian, 4 Western.

BREMSSTRAHLUNG FROM LONGITUDINAL PLASMA WAVES PRODUCED BY SUBTHERMAL ELECTRONS IN PLASMA

Yerevan IZVESTIYA AKADEMII NAUK ARMYANSKOY SSR: FIZIKA in Russian Vol 19, No 1, Jan-Feb 84 (manuscript received 4 Apr 83) pp 15-19

AKOPYAN, A. V., Institute of Radio Physics and Electronics, Armenian SSR Academy of Sciences

[Abstract] The bremsstrahlung produced by a longitudinal plasma wave (1-wave) created during collisions of nonequilibrium subthermal electrons and the ions of an isotropic, homogeneous fully ionized plasma is examined. Expressions are derived for the probability and intensity of radiation for pairwise electron-ion collision; the problem of wave instability during collective retardation of groups of electrons on ions is discussed. Collisions of subthermal electrons with one another and with thermal plasma electrons are shown to contribute little to the creation and amplification of 1-waves. Some numerical estimates are given. References 7: 6 Russian, 1 Western.

DIAGNOSIS OF STATIONARY OPTICAL DISCHARGE PLASMA IN LASER PLASMOTRON MODE

Moscow FIZIKA PLAZMY in Russian Vol 9, No 6, Nov-Dec 83 (manuscript received 28 Jan 82) pp 1269-1277

TERASIMENKO, M. V., KOZLOV, G. I. and KUZNETSOV, V. A., Institute of Mechanics, USSR Academy of Sciences

[Abstract] Results of spectral and holographic investigations of the parameters of the plasma produced by a laser plasmotron are presented. The mechanism by which the discharge temperature is established is determined, and the change in the structure of the light detonation wave as the velocity of the stabilizing gas stream increases is studied. It is demonstrated possible to increase significantly the parameters of an optical discharge plasma, thus opening up a way of obtaining a stationary nonideal plasma. Figures 7, references 10 Russian.

INJECTION OF COMPENSATED RELATIVISTIC ELECTRON BEAMS NEAR PLASMA HALF-SPACE

Moscow FIZIKA PLAZMY in Russian Vol 9, No 6, Nov-Dec 83 (manuscript received 5 Nov 81; revised 2 Aug 82) pp 1254-1260

GRIGOR'YEV, V. P., DIDENKO, A. N. and ISAYEV, G. P., Scientific Research Institute for Nuclear Physics, Tomsk Polytechnical Institute

[Abstract] The interaction of compensated relativistic high-current electron beams with a plasma half-space is examined theoretically. The plasma is assumed to be cold, and there are assumed to be no external fields. The density of the electron beam is smaller than that of the plasma electrons. An expression is derived for the permittivity tensor to describe the linear electromagnetic properties of the plasma. The influence of the intrinsic magnetic field of the beam on the plasma parameters is disregarded. The effect of refraction from a plasma layer can be used to transport pulsed electron beams with current of up to I_A if the pulse length is less than or approximately equal to y_1^{-1} . [Abstract] The spatial distributions of the ion temperature and exiting streams of charge transfer atoms in an L-2 stellator are obtained. The profile of the ion temperature is found to drop off toward the periphery of the plasma in the region opposite the direction of drift. The ion temperature profile in the direction of drift is distorted because of drifting of particles trapped in the corrugation of the helical field of the stellator. A model of the movement of trapped ions in the L-2 stellator is proposed. Figures 10, references 8: 5 Russian, 3 Western.

SMOLYAKOVA, O. B., SUVOROV, Ye. V., FRAYMAN, A. A. and KHOL'NOV, Yu. V., Institute of Applied Physics, USSR Academy of Sciences

[Abstract] A detailed experimental investigation is made of the transmission of linearly polarized radiation through a plasma. Two coherent normal waves are excited: the phase offset between these waves can lead to a significant change in the intensity of either linearly polarized component, even when there is no wave absorption in the plasma. An experimental setup is described that enables estimation of the optical thickness of the plasma for an extraordinary wave. The manner in which the parameters of the plasma vary can be judged by studying the temporal behavior of the intensities of a fixed-frequency signal with two orthogonal polarizations. A modification is proposed in which rapid scanning of the frequency of the probing radiation can be used to make measurements in a stationary plasma. Figures 5, references 7: 5 Russian, 2 Western.

ABSOLUTE INSTABILITY ACCOMPANYING STIMULATED BRILLOUIN SCATTERING IN LASER PLASMA

Moscow FIZIKA PLAZMY in Russian Vol 9, No 6, Nov-Dec 83 (manuscript received 29 Apr 82; revised 11 Nov 82) pp 1148-1156

ANDREYEV, A. A. and SHATSEV, A. N., State Optics Institute imeni S. I. Vavilov

[Abstract] The increments and frequencies of absolutely increasing modes are obtained as a function of the basic characteristics of the plasma, laser radiation and recording conditions of the scattered radiation; the saturation of absolute instability of stimulated Brillouin scattering in laser plasma is calculated. A laser plasma with $T_e \sim 1$ keV, $L_N \sim 0.01$ cm, $L_U > L_N$ and $\lambda_0 = 1 \mu$ is investigated. It is shown that absolute instability can be excited in the plasma for the laser radiation parameters used in the experiment. Figures 3, references 18: 10 Russian, 8 Western. [213-6900]

BIFURCATION OF EQUILIBRIUM FIGURES IN MAGNETOHYDRODYNAMICS AND INFLUENCE OF AUTOMATIC CONTROL SYSTEM

Moscow IZVESTIYA AKADEMII NAUK SSSR: MEKHANIKA ZHIDKOSTI I GAZA in Russian No 5, Sep-Oct 83 (manuscript received 29 Apr 82) pp 18-24

KOLODYAZHNYI, A. A. and LADIKOV, Yu. P.

[Abstract] Equilibrium bifurcations of a liquid metal (plasma) held in suspension by a magnetic field are employed to study bifurcation flow modes of

two layers of liquid in the long-wave approximation. Bifurcations of the solution of the problem of a plane layer of liquid metal contained by a magnetic field are investigated, as are bifurcations of a cylindrical conductor in a magnetic field. Bifurcation equilibrium forms are found to be symmetric with respect to the axis of the conductor. The influence of an automatic control system on bifurcation equilibrium forms is investigated; it is found that a single winding can affect the nature of bifurcation equilibrium forms. Figures 3, references 6 Russian.

(manuscript received 22 Mar 83; revised 6 Jun 83) pp 216-226

NERUKH, A. G., Kharkov Institute of Radioelectronics

[Abstract] The problem of the scattering of an electromagnetic wave normally incident on the plane boundary of a plasma half-space initiating uniform motion perpendicular to its boundary at some arbitrary moment is solved. The problem of diffraction is reduced to scatter form, and the equation for the field that enters the plasma medium is derived by the integral equation method. The problem is solved for the case in which the plasma begins to move at time zero; subsequent solutions in space-time representation are then obtained on the basis of general concepts regarding the polarization of a medium with space-time dispersions. The difference between the solution of the diffraction problem for the transmitted field when movement starts at time zero and at infinity is examined. The use of the integral equation method enables identification of all characteristics of electromagnetic wave diffraction on a plasma half-space that begins to move uniformly at a finite moment in time, as well as solution of such a diffraction problem. INCREASING BRIGHTNESS OF BEAM FROM ARC PROTON SOURCE

Moscow PRIBORY I TEKHNIKA EKSPERIMENTA in Russian No 1, Jan-Feb 84
(manuscript received 16 Sep 82) pp 44-49

BATKIN, V. I., GETMANOV, V. N. and SAVCHENKO, O. Ya., Institute of Chemical Kinetics and Combustion, Siberian Department, USSR Academy of Sciences

[Abstract] The design of a pulsed arc hydrogen plasma source with grid formation of a proton beam is optimized to increase beam brightness. This is achieved by employing a source in which the anode fitting and grid assembly can move independently. The relationship between the brightness of the beam generated and the state of the gas in the discharge chamber and in the region in which the plasma escapes from the outlet of the arc channel ahead of the plasma grid is studied experimentally. It is demonstrated that there is an optimum jet path length that depends on the flux density. A source that produces a beam of neutral hydrogen atoms obtained by overcharging the proton beam is also discussed. Figures 5, references 11: 9 Russian, 2 Western.

THEORY OF INTERACTION OF HIGH-CURRENT RELATIVISTIC ELECTRON BEAM AND MAGNETIZED PLASMA WAVEGUIDE

Moscow DOKLADY AKADEMII NAUK SSSR in Russian Vol 275, No 1, Mar 84
(manuscript received 1 Jun 83) pp 56-59

BLIOKH, Yu. P., KARAS', V. I., LYUBARSKIY, M. G., ONISHCHENKO, I. N. and academician (UkSSR Academy of Sciences) FAYNBERG, Ya. B., Kharkov Institute of Engineering Physics, UkSSR Academy of Sciences

[Abstract] Instability of a high-current relativistic electron beam propagating through a plasma in a waveguide in a strong external magnetic field is analyzed

on the basis of Cherenkov interaction and anomalous Doppler interaction. The corresponding dispersion equation reveals a maximum instability increment within the range of Cherenkov resonance for "weak" electron beams and within the range of Doppler resonance for "strong" electron beams. This change in hydrodynamic instability depending on the electron beam density is attributed to a change in the phase velocity of the fast Doppler wave, which in a strong electron beam exceeds the maximum phase velocity of the slow plasma wave. The dispersion equation was solved numerically for values of parameter $\mu^3 = \gamma n_b / n_p$ (γ - relativistic factor, n_b - beam density, n_p - plasma density) from 1 to 10 and for Cherenkov resonance frequency $\omega = \frac{1}{3} \omega_p$. The results reveal quasi-longitudinal polarization of the instability wave, while quasi-transverse polarization occurs and an instability threshold appears in the absence of Cherenkov resonance. The threshold density of the electron beam above which it becomes unstable is independent of the oscillation energy during the initial linear stage and subsequently becomes a function of the wave amplitude, only a small increase of the threshold being enough to stabilize the electron beam. A nonlinear theory is constructed on the basis of Maxwell equations and nonlinear equations of motion and continuity for beam electrons and plasma electrons. The existence of steady waves corresponding to 2 - periodic solutions with respect to the longitudinal variable only is established, also predominance of the anomalous Doppler effect over the Cherenkov effect in the case of high-current electron beams. The results indicate ways to optimize the design and the performance of relativistic microwave devices. Figure 1, references 5: 3 Russian, 2 Western.

BREMSSTRAHLUNG RADIATION FROM LONGITUDINAL PLASMA WAVES CAUSED BY SUBTHERMAL ELECTRONS IN PLASMA

Yerevan IZVESTIYA AKADEMII NAUK ARMYANSKOY SSR: FIZIKA in Russian Vol 19, No 1, Jan-Feb 84 (manuscript received 4 Apr 83) pp 15-19)

AKOPYAN, A. V., Institute of Radiophysics and Electronics, ArSSR Academy of Sciences

[Abstract] Longitudinal plasma wave bremsstrahlung is produced in the collision of nonequilibrium subthermal electrons with the ions of an isotropic homogeneous completely ionized plasma. The velocity of the test electrons is less than the average thermal velocity of the plasma electrons (maxwellian velocity), but still high enough to allow the applicability of a quasiclassical approximation. The density of the test electrons is assumed to be much less than the plasma thermal electron density. Analytical expressions are derived for the bremsstrahlung probability and spectral intensity. The collision of a group of test electrons and plasma ions involving both spontaneous and stimulated bremsstrahlung is analyzed and the expressions describing the braking instability of the plasma waves derived in this instance are illustrated as applied to the case of slow electrons distributed in the form of a directional flow so that the distribution function falls off markedly when the velocity is in the vicinity of the average

velocity of the flow and the electrons are uniformly spatially distributed in the flow. Collisions of subthermal electrons with each other and with thermal plasma electrons are also possible in a plasma, however analysis shows that the contributions of these processes to the production and amplification of longitudinal waves are small. A numerical estimate shows that when the plasma temperature is about 10^3 eV, the plasma density is about 10^{15} cm $^{-3}$, the flow density is about 10^{10} cm $^{-3}$ and the average flow velocity is on the order of 10^8 cm/s, plasma waves with wavelengths of approximately 10^{-1} cm and longer will appear during a characteristic time of about 10^{-2} s. References 7 Russian. [238-8225]

MECHANISM OF BRITTLE HEAT FRACTURE OF INHOMOGENEOUS SOLIDS BY HIGH TEMPERATURE GAS JETS

Moscow DOKLADY AKADEMII NAUK SSSR in Russian Vol 272, No 2, Sep 83
(manuscript received 8 Dec 82) pp 358-361

DIMITIYEV, A. P., GONCHAROV, S. A. and GERMANOVICH, L. N., Moscow Mining Institute

[Abstract] The mechanism of brittle fracture inhomogeneous solids by high temperature gas jets occurring in heat treatment of materials, plasma spraying, heat fracture of rocks and other physico-technical processes is studied. Since fractured surface areas are significantly smaller than the dimensions of the body, an infinite half-space is conceived as thermally fracturing with convective heat exchange with a gas jet on the boundary. A model of a two-component random-nonhomogeneous granular medium is used. Thermal stresses concentrate in a narrow surface layer where particles are thin and flat so that rupture occurs by stability loss. When the disrupted layer is sufficiently thick and temperature and heat exchange values not too high, thermal fracture occurs by peeling but when the disrupted layer thickness is small and temperatures and heat exchange values high stability loss does not occur and the surface cracks. In brittle peeling, temperature goes from microfracture to fracture temperature which is less than the melting point and this pattern explains fracture mechanisms and rock behavior in thermal drilling. Figure 1, references 10 Russian.

SALGANIK, R. L., SLUTSKER, A. I. and AYDAROV, Kh., Physico-Technical Institute imeni A. F. Ioffe, USSR Academy of Sciences, Leningrad; Institution of Problems of Mechanics, USSR Academy of Sciences, Moscow

[Abstract] Research on solid body kinetic fracturing shows the role of thermal fluctuation fracturing of interatomic bonds. Fracturing constitutes one of the forms of chemical solid-phase reactions and has a characteristic Arrhenius ratio of reaction rate to temperature. Because of the exponential increase in the rate of interatomic bond breakdown with increasing tension, sample durability coincides logarithmically with the average expectation time for interatomic bond fracture. The structure of the test material affects only the steepness of the fracture barrier as the tension increases and a drop in temperature should affect quantum characteristics of bond breakage. Quantum effects are taken into account in the study of collective movements of atoms under strong tension and have been studied for simple atom chains and on the basis of single-particle tunneling. The resulting model is applied to larger structures and quantum features are experimentally studied in the fracturing of boron fibers and the polymers kevlar-49 and polycaprimade at temperatures from 4.2 K to 400-800 K. The results show kinetic fracturing as a process in which, at temperatures significantly lower than the characteristic temperature for the material, a significant role is played by quantum fluctuations, while thermal fluctuation effects increase with the temperature and predominate above the characteristic temperature. DYNAMICS OF WAVE PROCESSES IN SPHERICAL EXPLOSION CHAMBER

Minsk DOKLADY AKADEMII NAUK BELORUSSKOY SSR in Russian Vol 28, No 2, Feb 84
(manuscript received 12 Apr 83) pp 143-145

MARCHENKO, A. I. and ROMANOV, G. S., Scientific Research Institute of Application Problems in Physics imeni A. N. Sevchenko

[Abstract] Wave processes in a spherical explosion chamber are analyzed on the basis of a mechanical and gas dynamic model. Wave motion and elastic stresses produced inside such a chamber by a shock load on its wall are calculated, disregarding the practically significant but theoretically irrelevant strength characteristics and dissipation effects. The corresponding equations for a mechanically continuous multiregional medium with spherical symmetry are formulated in Lagrange coordinates. These equations have been solved by numerical methods, with the thermodynamic state described by Tillotson equations and the stress-strain relations corrected in accordance with the Mises condition for an elastoplastic material. The results reveal oscillations of thermodynamic variables at the chamber wall, depending on the wave dynamics inside the chamber. Multiple reflections of shock wave pulses stabilize the frequency of these oscillations at approximately 4 kHz and their amplitude, after initial attenuation. The results also reveal an elastic stress field in the wall chamber that excites elastic waves propagating through the chamber. The model is found to yield more valid and rigorous data than models based on constant pressure or its simple analytical approximations. Article was presented by Academician (BSSR Academy of Sciences) R. I. Soloukhin. Figures 2, references 8 Russian.

GRAVITATIONAL VACUUM

Moscow DOKLADY AKADEMII NAUK SSSR in Russian Vol 274, No 6, Feb 84
(manuscript received 16 Aug 83) pp 1352-1357

GRIGORYAN, L. Sh. and SAAKYAN, G. S., corresponding member ArSSR Academy of Sciences; Yerevan State University

[Abstract] It has been through that gravitation changes only the space-time metric but it can be supposed that through homogeneity and isotropy disturbances the physical state of the vacuum can change leading to a special gravitational vacuum. Polarization effects have been supposed to generate a gravitational vacuum but it might also be due to elastic tensions resulting from space distortions and the Casimir effect and quark processes may be examples. The paper supposes the existence of a special gravitational vacuum and utilizes a phenomenological method differing from the traditional einsteinian formalizations. Vacuum, metric and matter form a complex determined by field equations and at great distances from gravitational masses vacuum effects are small but could be large in powerful fields. Singularities and black holes justify the approach as well as the Ambartsumyan theory concerning the existence of supermassive and superdense prestellar bodies that then disintegrate. A theory for these superdense bodies is developed involving gravitational field equations that describe the vacuum by an energy-momentum tensor and define the field and mass distribution. Computations based on the theory for gravitational radii with incompressible liquid models adequately reflecting real conditions indicate that a gravitational vacuum could have considerable effects on superdense stars and could have radical effects for very large masses. Figures 2, references 1 Russian.

LINEAR CONFORMAL GRAVITATION

Moscow DOKLADY AKADEMII NAUK SSSR in Russian Vol 274, No 6, Feb 84
(manuscript received 25 Jul 83) pp 1345-1348

PAL'CHIK, M. Ya. and FRADKIN, Ye. S., corresponding member, USSR Academy of Sciences; Physics Institute imeni P. N. Lebedev, USSR Academy of Sciences, Moscow

[Abstract] Conformal gravitation described by a lagrangian involving a Weyl tensor forms a field theory of interest for the quantum gravitation problem. Einsteinian gravity acting over large distances arises as a result of dynamic symmetry breaking while small distances are fully described by conformal gravitation. The latter is analyzed in the paper on the supposition that solutions have complete conformal symmetry but this is justified only for small distances and determined types of material fields. Two cases are shown for which solutions are possible: a) special fields whose interactions result in the absence of conformal anomalies (for example, in relation to conformal supergravitation) and b) for link constants coinciding with Gell-Mann function zeroes. Consideration is limited to linear gravitation or abelian gage theory. The solution of the quantum equation is invariant relative to the conformal transformations but contradictions arise due to difficulties in all gage theories. Recent advances in quantum electrodynamics are used and the authors develop improved transformation laws and a non-trivial metric field generator and show that the tensor equations express the equivalence of the conformal group representation. Representation spaces and subspaces, and equivalence and invariance characteristics are examined. References 11: 2 Russian, 9 Western.

SIMULATION OF PROCESS OF ION ACCUMULATION IN ELECTRON BEAMS

Leningrad ZHURNAL TEKHNIЧЕСКОY FIZIKI in Russian Vol 54, No 2, Feb 84
(manuscript received 26 Jul 82; revised 12 Jun 83) pp 270-278

PEREL'SHTEYN, E. A., SHEVTSOV, V. F., SHIRKOV, G. D., and SHCHINOV, B. G.

[Abstract] The distribution function of ions during sequential accumulation of ion charges is studied. The influence of nonlinearity of the electron fields and intrinsic fields of the ions on the movement and distribution function of ions is studied with respect to the cross section of a circular beam. The findings are valid for sufficiently thin electron rings, for which field corrections associated with curvature can be disregarded. The influence of ion charge on the distribution function of ions and electrons, and the electrical field potential, is investigated by the large-particle method. The accumulation and transition of ions from charge to charge is modeled by examining several charges simultaneously, and the dynamics of the variation in the mean square dimensions and velocities is modeled as a function of the ion charge. DYNAMICS OF STRONG-CURRENT RELATIVISTIC ELECTRON BEAM IN EXTERNAL MAGNETIC FIELD

Kiev DOKLADY AKADEMII NAUK UKRAINSKOY SSR: SERIYA A, FIZIKO-MATEMATICHESKIYE I TEKHNIЧЕСКИYE NAUKI in Russian No 4, Apr 84 (manuscript received 22 Feb 83) pp 61-63

ZOLOTARYUK, A. V., KUZ'MENKO, N. V. and KHODATAYEV, K. V., Institute of Theoretical Physics, Ukrainian Academy of Sciences

[Abstract] The dynamics of a relativistic electron beam injected into a cylindrical vacuum drift tube with constant cross section in an external axial magnetic field is analyzed. The nonstationary transport model of the beam is described by a system of Maxwell-Vlasov equations. The Maxwell equations are solved by a finite-difference algorithm, and the Vlasov equation by the macroparticle method. The space-time structure of the transport process is described as a function of the external magnetic field, and the relationship between the critical current and the system parameters is specified. Figures 2, references 6: 4 Russian, 2 Western.

[Abstract] Mathematical modeling of variable and transient processes is examined on the basis of a closed system of differential equations describing the physical processes occurring in turbine channels during chemical reactions in the coolant. Unidimensional differential equations in dimensionless form based on the generalized transfer equation are employed in the modeling. Analysis of the data shows that the transient processes occurring in the cases considered are practically inertialess. Figures 2, references 5 Russian. [298-6900]

ANALYTICAL SOLUTIONS OF EQUATION OF KINETICS FOR CONDENSATION SIZE SPECTRUM OF CLOUD DROPS

Moscow DOKLADY AKADEMII NAUK SSSR in Russian Vol 274, No 6, Feb 84 (manuscript received 24 Mar 83) pp 1368-1372

SMIRNOV, V. I. and NADEYKINA, L. A., Central Aerological Observatory, Dolgorudnyy, Moscow Oblast

[Abstract] Condensation of water vapor in the atmosphere as a result of cooling of the ascending air is analyzed, including the effects of turbulence and hygroscopicity of cloud seeds as well as the effects of time diversity between drops and of air entrainment from below. The size distribution of water drops is characterized by the spectrum function $f(t, x, r, c, \tau)$ (t - time, $dx = dx_1 dx_2 dx_3$ - volume element), where the radius of a drop increase from r to $r + dr$ while the age of a seed and the condensation activity on it increase respectively from τ to $\tau + d\tau$ and from c to $c + dc$. An equation for this spectrum function, normalized to the drop concentration, is obtained from the law of drop growth by condensation with conservation of mass and energy. This equation is solved analytically, after averaging over turbulent fluxes and subsequent generalization. One specific example considered is steady lateral migration of seeds into a cloud and downward precipitation of drops from it, with diffusion taken into account. The extreme two cases here are very small and very large free-molecule radii with correspondingly high and low values of the condensation coefficient. Vertical turbulence influences the mean radius of drops but not the form of their size distribution and the variance. Another specific example considered is a cluster of large drops, where only age and hygroscopicity of

seeds determine the size distribution of drops. Here during lateral mass transfer the wetness of a cloud depends on the velocity of ascending air and the spectrum widens as the condensation coefficient decreases (the free-molecule radius increases), which is characteristic of a nonadiabatic process and a dirty drop surface. Article was presented by Academician I. V. Petryanov-Sokolov on 28 February 1983. References 13: 9 Russian, 4 Western.

METHOD OF SPLITTING FOR SOLUTION OF PROBLEMS IN SEMICONDUCTOR PHYSICS

Moscow DOKLADY AKADEMII NAUK SSSR in Russian Vol 274, No 6, Feb 84
(manuscript received 14 Sep 83) pp 1338-1340

BEREZIN, Yu. A. and Academician YANENKO, N. N. (deceased)

[Abstract] The drift-diffusion (hydrodynamic) mathematical model of a semiconductor includes equations of continuity for electrons and holes in addition to the Poisson equation for the electric potential with space-charge density. This model is based on the premise that all parameters of a semiconductor device are functions of the instantaneous electric field intensity. This assumption ceases to be valid as the trend of device miniaturization continues and the kinetic model on the basis of Boltzmann equations for electrons and holes moving in a self-consistent electric field with scattering becomes more appropriate. In an intermediate position is the three-moment model with differential equations of transport derived from the Boltzmann equation of kinetics for the first three moments of the distribution function (density, momentum, temperature) and the collision terms calculated in accordance with the theory of scattering in semiconductors. For mathematical simulation of nonlinear and transient processes, which is now done by analytical and numerical methods based on the fundamental drift and diffusion equations in one-dimensional or two-dimensional formulation, these authors have proposed an efficient implicit finite-difference scheme with fractional steps applicable to a two-dimensional or three-dimensional system of those equations. Assuming constant electron and hole mobilities, constant permittivity of the material, zero generation of electron-hole pairs by impact ionization, and zero recombination, the system of equations is split with respect to the space coordinates as well as with respect to the two physical processes. The algorithm of its solution consists of successive fractional steps, first approximation of transport and diffusion along each coordinate, then adaptation of electron and hole concentrations at selected instants of time, and solving the Poisson equation by any iteration method. The order of approximation in time can be raised by the standard predictor-corrector procedure. Calculations for an MOS transistor with induced n-channel by this method have yielded excellent results. References 7: 3 Russian, 4 Western.

SELF-ADJOINT SOLUTION OF EQUATION OF BOUNDARY LAYER FOR CATALYTIC SURFACE

Moscow DOKLADY AKADEMII NAUK SSSR in Russian Vol 274, No 6, Dec 84
(manuscript received 14 Nov 83) pp 1321-1325

Academician STRUMINSKIY, V. V., "Mechanics of Nonhomogeneous Media" Sector,
USSR Academy of Sciences, Moscow

[Abstract] The structure of the boundary layer at a catalytic surface is analyzed, assuming that heterogeneous chemical reactions at such a surface proceed at a rate proportional to friction. The validity of this assumption is proved rigorously, for Couette flow between infinitely large plates without edge effect as well as for the vicinity of a stagnation point. The two-dimensional equations of motion and concentration distribution in a boundary layer are solved in accordance with the kinetic theory of gases, considering heterogeneous chemical reactions at the surface as well as homogeneous chemical reactions far from the surface. The former depend on and follow impact of gas molecules directly on the surface with attendant momentum transfer. The latter follow collisions between gas molecules and depend on their concentrations. A new self-adjoint solution of these equations is obtained on this premise, according to which the reagent concentration at the surface is uniform over the area. It reveals new possibilities for improvement of catalytic technological processes. This is demonstrated on conversion of methane with water vapor in a turbular-furnace where a heap of hollow cylindrical stubs of catalytic material provides a large effective catalytic surface. ASYMPTOTES TO TRAJECTORY OF CENTER OF MASS OF ROTATING BODY

Alma-Ata IZVESTIYA AKADEMII NAUK KAZAKHSKOY SSR: SERIYA FIZIKO-MATEMATICHESKAYA
in Russian No 1(116), Jan-Feb 84 (manuscript received 22 Apr 83) pp 55-58

MYNBAYEVA, S. M., Alma-Ata Institute of Power Engineering

[Abstract] A body of unit mass is considered rotating in a medium with drag in a constant thrust field, its angular velocity $\omega(t)$ as function of time given and all forces acting on the body applied at its center of mass. The equation for the velocity of the center of mass $dv/dt = b(t) \times v + G - \frac{F(|v|)}{|v|} v$ ($v(0) = v_0$, $v \in R^3$, $t \in R_+$, $b(t) = c_0 \omega(t)$, c_0 - real coefficient depending on geometry of body and density of ambient medium, $G = (0, 0, g)$ - vector of gravitational acceleration, F - nondecreasing continuous function defined on semisxis $R_+ = [0, \infty]$ such that $F(0) = 0$) is analyzed for the nonlinear case. On the basis of an existence and uniqueness theorem for the solution of this equation, stated without proof and bounding the solution on R_+ , two theorems are formulated for

asymptotes to the trajectory $x(t)$ of the center of mass. The first theorem, states with proof and followed by two lemmas, applies to $\lim_{t \rightarrow \infty} b(t) = b$ and a monotonic function F . The second theorem, stated without proof, applied a continuous $b(t)$ with $\lim_{t \rightarrow \infty} b(t) = b$ ($\int_0^{\infty} |b(\tau) - b| d\tau > \infty$) and $F(r) = cr$ ($c > 0$).

VELOCITY OF PROPAGATION OF WEAK DISTURBANCES IN WATER WITH STEAM BUBBLES

Moscow DOKLADY AKADEMII NAUK SSSR in Russian Vol 273, No 6, Dec 83
(manuscript received 30 Jun 83), pp 1355-1358

KUZNETSOV, N. M., TIMOFEYEV, Ye. I., POLENOV, A. N. and GUBANOV, A. V.,
Institute of Chemical Physics, USSR Academy of Sciences, Moscow

[Abstract] Propagation velocity of weak disturbances in two-phase equilibrium media with low steam content is computed to be low but such low velocities have not been obtained experimentally and shock wave speeds generally coincide with the speed of sound. In order to lower the wave velocity, experiments are down with apparatus to reduce initial steam bubble diameter so that the inter-phase surface for a unit mass of steam increases and the relaxation time is shortened. Computations based on a theoretical heat transfer and condensation model show that for the reduced bubble dimensions velocity should be reduced but experimental results indicate that in spite of a reduction of bubble diameter by a factor of five a velocity drop of the order of 1 m/s was not obtained. This is linked to the anomalous compressibility of the two-phase system. The mechanisms are discussed in terms of the thermodynamic conditions. Figures 3, references 9: 6 Russian, 3 Western.

technical Institute, Dolgoprudnyy, Moscow Oblast

[Abstract] Metal destruction in liquid media by laser radiation with breakdown near the metal-liquid interface is studied. Computations show that metal fusion beyond the focal spot is possible in immersed breakdown only for pulses

longer than 1 microsecond indicating the interest of comparing fusion characteristics for pulses ranging in length from 10 nanoseconds to 1 microsecond with breakdown energies. Experiments are done with 50 nanosecond and 0.5 microsecond XeCl-laser pulses with energies respectively of 0.2 and 2 J in air and water. Damage was greater in water and fusion traces were found beyond the focal spot area for the longer pulses. Results showed that underwater laser effectiveness increases as breakdown develops at the interface and is determined by vaporization, fusion and plastic deformation which is important in cavity formation in plastic materials with pulses over several tens of nanoseconds. Evacuation of fused material by laser breakdown plasma pressure is significant for microsecond length pulses. Figures 3, references 11: 6 Russian, 5 Western.

INVESTIGATION OF CRITICAL PHENOMENA IN SYSTEMS WITH TWO COMPETING EXO- AND ENDOTHERMIC REACTIONS. I. THERMAL EXPLOSION

Novosibirsk FIZIKA GORENIYA I VZRYVA in Russian Vol 20, No 1, Jan-Feb 84
(manuscript received 11 Jan 83) pp 55-62

BOROVNIKOV, M. B., GOL'DSHLEGER, U. I. and BUROVOY, I. A.

[Abstract] The principles underlying the development of thermal explosion in systems with two competing exo- and endothermic reactions are studied. The temperature of the quasistationary mode for a given degree of conversion is found to be determined by the ratio of the characteristic rates of heat release and heat absorption. Examples of the step kinetics and autocatalytic reactions involved are analyzed to determine which critical phenomena, and in what combination, can be encountered in a given region of the parameters. Figures 6, references 4 Russian.

(manuscript received 11 Jan 83) pp 62-65

BOROVNIKOV, M. B., GOL'DSHLEGER, U. I. and BUROVOY, I. A.

[Abstract] Changes in transformation modes (quenching, ignition, etc.) are studied, as well as the occurrence of new modes, using the approximation of intense heating and mass exchange within an ideal mixing reactor. Continuous interchange between the reactor and the environment causes quasisteady transformations that can either increase or decrease the degree of transformation of the original reagent. The difference between the transformation modes in an ideal mixing reactor and a closed system is analyzed. The kinetic curves and critical values of Da are analyzed. Figures 3, references 2 Russian.

LOW TEMPERATURE OXIDATION OF MIXTURE OF TITANIUM WITH CARBON BLACK AND BORON
IN AIR

Novosibirsk FIZIKA GORENIYA I VZRYVA in Russian Vol 20, No 1, Jan-Feb 84
(manuscript received 23 Sep 82) pp 43-48

YELIZAROVA, V. A., ROZENBAND, V. I., BABAYTSEV, I. V., GERUSOVA, V. P. and
BARZYKIN, V. V.

[Abstract] Low temperature oxidation of a mixture of titanium with carbon black and boron in air preceding ignition is studied by nonisothermal thermography, in which the substance is heated linearly at a given rate. The relationship between the temperature difference between blocks containing the investigated charge and an inert substance, characterizing the heat release of the oxidation reaction, is found as a function of the block temperature t_0 . Adding carbon black to titanium instead of boron increases the heat release rate of the oxidation reaction. Data from thermographic and thermogravimetric investigations are presented, indicating that the heat release rate of the boron oxidation reaction exceeds that of carbon. Figures 3, references 5 Russian.

CONDITIONS FOR SPONTANEOUS ACCELERATION OF THERMAL DECOMPOSITION OF THERMALLY
UNSTABLE SOLID SUBSTANCES DURING BRIEF HEATING

Novosibirsk FIZIKA GORENIYA I VZRYVA in Russian Vol 20, No 1, Jan-Feb 84
(manuscript received 24 Jun 82; revised 17 Jan 83) pp 40-43

SHLENSKIY, O. F. and AFANAS'YEV, N. V.

[Abstract] Conditions supporting spontaneous combustion of solid materials are examined. It is found that when a substance is heated rapidly to a minimum critical temperature a spontaneously accelerating rise in the temperature occurs. In addition to reaching the critical temperature, it is also necessary for the applied heat to be brief enough for the chemical phase transmission mechanism to be implemented. The behavior of the kinetic processes occurring is analyzed, and the minimum thermal exposure time for exciting the chemical-phase spontaneous mechanism is determined. Figure 1, references 10 Russian.

ESTIMATION OF TYPE OF MAXIMUM LIKELIHOOD FOR NONPARAMETRIC REGRESSION

Moscow DOKLADY AKADEMII NAUK SSSR in Russian Vol 273, No 6, Dec 83
(manuscript received 10 Mar 83) pp 1310-1314

NEMIROVSKIY, A. S., POLYAK, B. T. and TSYBAKOV, A. B., Institute of Data
Transmission Problems, USSR Academy of Sciences, Moscow

[Abstract] An improved likelihood method for random values is presented for
nonparametric regression that has the advantage of being uniform for parametric
and nonparametric cases and can compute a priori data for the random value
distribution law while the statistical characteristics of the estimate are
not worse than for linear estimates and estimates for many classes of functions

are spline. Problems involved in practical applications involve the setting of constants for functions and a large volume of computations but the method can be generalized to solution of nonparametric problems such as the establishment of density distribution, solution of integral equations with second member fixed at a finite point in the presence of random errors and establishment of functions when other functions are known for the point.

EQUIVALENT FEEDBACK IN LINEAR STATIONARY CONTROL SYSTEMS

Moscow AVTOMATIKA I TELEMEXHANIKA in Russian No 2, Feb 84 (manuscript received 22 Mar 82) pp 54-65

YAKUBOVICH, V. A. and YAKUBOVICH, Ye. D.

[Abstract] Various optimization problems concerning analytic regulator theory and the minimization of dispersion due to white noise, stationary disturbances, control problems, etc., involve the establishment of feedback mechanisms. In practice, it is difficult to measure all the components of the state vector upon which the regulation device is to be based and it is necessary to replace the original feedback system by an equivalent system relating to a certain scalar output variable. The question arises as to the existence of the equivalent feedback solution. The application of the Wiener factorization method for input-output variables and the generation of optimal linear regulator solutions suggests that, in the general case, equivalent feedbacks do exist. However they are not always possible and the study establishes sufficient and necessary criteria for their existence and examples of the application of the method are given. OPTIMAL CONTROL WITH MULTIPLE CRITERIA

Moscow AVTOMATIKA I TELEMEXHANIKA in Russian No 2, Feb 84 (manuscript received 24 May 82) pp 27-32

VINOGRADSKAYA, T. M., MAKAROV, I. M., RUBCHINSKIY, A. A., SOKOLOV, V. B. and SHCHERBAKOV, A. V.

[Abstract] Several criteria must be taken into account simultaneously in the solution of applied problems such as spacecraft design where payload is to be maximized for a minimum time for minimal fuel expenditure or economic planning where sector outputs are maximized in minimal times under resource constraint conditions. Special theoretical constructs are developed for these problems

and control equations are generated. The present paper describes the optimization principle by a binary function or by utility functions. The concept of R-optimality is introduced for broad classes of R relations. For cases in which the optimization principle takes the form of a prior unknown utility functions, an iterative procedure is introduced that produces an optimal control solution on the basis of limited information. An example is discussed consisting of a three-sector economic system in which one sector generates funds to be optimally used by the other two. References 4 Russian.

SOLVABILITY OF MIXED PROBLEM FOR NONLINEAR SCHROEDINGER-TYPE EQUATION

Moscow DOKLADY AKADEMII NAUK SSSR in Russian Vol 275, No 4, Apr 84
(manuscript received 8 Dec 83) pp 780-783

VLADIMIROV, M. V., Scientific Research Computer Center, Moscow State University
imeni M. V. Lomonosov

[Abstract] The problem of the existence and uniqueness of a generalized solution of a mixed problem for a nonlinear Schroedinger-type equation with specified boundary and initial conditions is examined. The equation is shown to be solvable on the whole for $0 \leq p \leq q$, $\beta > 0$, and any real α . The solution is found to be unique for $p=2$, $q \geq 0$, $\beta \geq 0$. The existence of the solution to the problem is proved by Galerkin's method. References 6: 5 Russian, 1 Western.

AUTOMATIC COMPUTER CONSTRUCTION AND INVESTIGATION OF DIFFERENCE SCHEMES IN ANALYTICAL FORM

Moscow DOKLADY AKADEMII NAUK SSSR in Russian Vol 275, No 3, Mar 84
(manuscript received 29 Jul 83) pp 528-532

VALIULLIN, A. N., GANZHA, V. G., IL'IN, V. P., SHAPEYEV, V. P. and academician YANENKO, N. N., Institute of Theoretical and Applied Mechanics, Siberian Department, USSR Academy of Sciences, Novosibirsk

[Abstract] A unified formalized algorithm is developed for the undefined coefficient method in order to approximate the various differential equations on different grid templates with arbitrary ordering; the algorithm is implemented by computer with the help of symbolic operations. An example is presented for the Dirichlet problem for the Poisson equation of a new monotonic fourth-order difference approximation. A numerical experiment to check the difference equations obtained is described. A package of programs is described that automates a number of algorithms. SOLUTION OF MULTICRITERIAL PROBLEMS OF OPTIMAL MACHINE AND MECHANISM DESIGN

Kiev DOKLADY AKADEMII NAUK UKRAINSKOY SSR: SERIYA A, FIZIKO-MATEMATICHESKIYE I TEKHNIЧЕСKIYE NAUKI in Russian No 4, Apr 84 (manuscript received 14 Feb 83) pp 68-72

CHERVONENKO, A. G. and GRIGORENKO, G. I., Institute of Geotechnical Mechanics, Ukrainian SSR Academy of Sciences

[Abstract] A new approach is reported for solving multicriterial optimal machinery design problems in which a Pareto set of optimal models of the machine is first constructed by isolating effective solutions during global sounding of the parameter space by multidimensional Sobol' points uniformly filling that space. This is followed by identifying a compromise optimal model of the machine with the participation of the decision maker. A numerical algorithm for global sounding of the parameter space is presented. The method is demonstrated using the example of selecting optimum parameters for a vibration conveyor for carrying minerals from a mine. References 6 Russian. [301-6900]

NORMALIZED EIGENFUNCTIONS OF TWO-POINT NONLINEAR BOUNDARY VALUE PROBLEM

Kiev DOKLADY AKADEMII NAUK UKRAINSKOY SSR: SERIYA A, FIZIKO-MATEMATICHESKIYE I TEKHNIЧЕСKIY NAUKI in Russian No 4, Apr 84 (manuscript received 22 Jul 83) pp 4-8

DYMARSKIY, Ya. M., Voroshilovgrad Pedagogical Institute imeni T. G. Shevchento

[Abstract] The author considers a nonlinear boundary value problem with eigenvalues $u'' + \lambda A(x, u, u')u + B(x, u, u') = 0$, $u(0) = u(\pi) = 0$, where λ is a real number, and the functions $A(x, y, z)$ and $B(x, y, z)$ are defined on the set $[0, \pi] \times R^1 \times R^1$ and are continuous with respect to the set of arguments in the entire domain of definition. Two theorems, one concerning the existence of two countable sequences of solutions and the other concerning a priori estimates, are formulated and proved. References 2 Russian. [301-6900]

SOLUTION OF NONLINEAR PROBLEMS

BANDURIN, N. G. and NIKOLAYEV, A. P.

[Abstract] A step method is proposed for solving systems of nonlinear equations for unknown functions depending upon a single parameter in which the increment vector of the sought functions is computed in each step from linear algebraic equations derived by expanding the first member of the original system in a Taylor series and retaining the discrepancy vectors. The Cauchy problem is solved for a system of ordinary nonlinear integrodifferential equations by solving a system of linear equations for the highest-order derivatives in each step. The system of partial integrodifferential equations is solved as a Cauchy problem for the system of ordinary integrodifferential equations derived from the system in question by discretizing it with respect to all arguments except for one, which is used as a parameter. YAKOVLEV, S. A.

[Abstract] A Neumann-Pearson decision making scheme is examined for the class of determinant optimal decision rules based on the sign of a given function. The properties of localizable functions are investigated. A formal description of the proposed scheme is provided, and estimates of the recognition error are derived. A localization theorem is stated and proved, and probabilistic passage to the limit is investigated. References 6 Russian. [292-6900]

SOME MODIFICATIONS OF SHOOTING METHOD FOR SOLVING NONLINEAR TWO-POINT BOUNDARY VALUE PROBLEMS

Moscow ZHURNAL VYCHISLITEL'NOY MATEMATIKI I MATEMATICHESKOY FIZIKI in Russian
Vol 24, No 4, Apr 84 (manuscript received 20 May 82; revised 7 Dec 82)
pp 504-513

GAYDUK, V. F.

[Abstract] Modifications are proposed for the shooting method employed for solving boundary value problems for ordinary difference equations in which the

shooting is structured so that the requirements that the Cauchy problem be solvable over the entire integration segment $[0, t]$ can be relaxed. It is shown that a converging shooting process can be constructed by computing the shooting trajectories until they are all contained in some set within which the boundary value problem is solvable. A method for sequential organization of shooting is described in which the solution of the boundary value problem is sought sequentially. The method is illustrated by solving a test problem and calculating the stressed state of a flexible rod. Figures 2, references 12: 9 Russian, 3 Western.

ASYMPTOTIC DECOMPOSITION OF SYSTEMS OF ORDINARY NONLINEAR DIFFERENTIAL EQUATIONS

Kiev UKRAINSKIY MATEMATICHESKIY ZHURNAL in Russian Vol 36, No 1, Jan-Feb 84
(manuscript received 15 Jun 83) pp 35-45

MITROPOL'SKIY, Yu. A. and LOPATIN, A. K., Institute of Mathematics, UkSSR Academy of Sciences, Kiev

[Abstract] G. Hori's theory of general perturbations with unspecified canonical variables which was the first to use Lie series for the substitution of variables is employed here to extend the averaging technique of N. N. Bogolyubov to the derivation of an asymptotic decomposition algorithm for systems of nonlinear ordinary differential equations. The algebra of the centralizer β_0^k

of the perturbed system is constructed and the conditions for the separation of variables in the transformed system of the centralizer into fast and slow variables are established. The conditions for the decomposability of this system into smaller subsystems in any approximation are also ascertained. In substantiating the proposed algorithm, a transition was made from a Jacobi system to a system of linear ordinary differential equations, which requires knowledge of the general solution and the first integrals of the zero approximation system. For systems with polynomial coefficients, the corresponding Jacobi systems can be solved directly without transition to ordinary differential equations, and the elements of the centralizer algebra and operators of the reducing transform can be found without knowing the general solution or the first integrals. The algorithm derived here, in contrast to the averaging method of N. N. Bogolyubov and the variants of it for systems of differential equations with fast and slow variables, does not require the reduction of the system being studied to standard form. As opposed to that asymptotic method, no explicit form of the solution of the zero order approximation system is used; only the structural properties of the enveloping Lie algebra of the zero order approximation system and the initial system are employed. The algebra of the centralizer is thus equivalent to a generalization of an averaging operator. References 14: 8 Russian, 5 Western.

EXECUTION OF LINEAR ALGEBRA ALGORITHMS IN PARALLEL USING MODULAR CODING PRINCIPLES

Alma-Ata VESTNIK AKADEMII NAUK KAZAKHSKOY SSR in Russian No 3, Mar 84 pp 33-39

AMERBAYEV, V. M., corresponding member of KaSSR Academy of Sciences, PAK, I. T., candidate of technical sciences

[Abstract] While the major operations of linear algebra (scalar multiplication of vectors, multiplication of matrices by a vector, multiplication of a matrix by a matrix) represent a class of procedures most efficiently handled in a gaussian arithmetic, computations involving large vector and matrix systems require not only copious calculations, but also accurate accounting for the error accumulation processes. In case of inadequate computer capacity, the accuracy of the computed value of a scalar product can be in doubt; the only way of enhancing the precision is then increasing computer capacity and correspondingly reducing the cumulative error in the initial data. This paper is a detailed theoretical treatment of calculations on a ring of a complete system of PCZ residues. The concept of an arithmetic expression in an alphabet $A = CZ_p \cup \cup_0$ is introduced; the variables and constants are arithmetic expressions and the simple operations of addition, subtraction, multiplication and division of these expressions are also arithmetic expressions. Matrix schemes for modular vector calculations on CZ_p are presented. A theorem demonstrating the solvability of CZ_p systems using a gaussian algorithm is stated and proved. Conditions are defined under which computations in modular arithmetic, representing calculations in a ring of integer gaussian numbers or with any limitations on the computation in a gaussian number ring, can be interpreted in residue ring language without losing computational precision. The question of matching the dynamic and machine ranges for computations of this type is analyzed for the case of a fixed decimal point mode as the most acceptable for modular arithmetic. Modular arithmetic is the most efficient in solving high order systems using iteration methods. Each iteration cycle requires $2n^2$ modular operations and is concluded with a comparison of the values from rounding-off operations. The overall number of rounding operations is $2nm$, where m is the number of iterations needed to obtain a solution of the requisite accuracy. References 3 Russian.
